dilemma (di- or di-lem'ā), *n.* [= F. *dilemme* = Sp. *dilema* = Pg. It. *dilemma* = D. G. Dan. Not "an argument in which the adversary is 'caught between' (*διὰ λαμβάνεται*) two difficulties," nor derived from *διὰ λαμβάνεσθαι*, be caught between.] **1.** A form of argument in which it is shown that whoever maintains a certain proposition must accept one or other of two alternative conclusions, and that each of these involves the denial of the proposition in question. The alternatives are called the *horns of the dilemma*, which is also called a *horned syllogism*. The argument is also called a dilemma, in a looser sense, when the number of such horns exceeds two. The dilemma originated in rhetoric, and was not noticed by logicians before the revival of learning; consequently there has been some dispute as to its logical definition and analysis. The standard example (from Aulus Gellius) is as follows: Every woman is fair or ugly; it is not good to marry a fair wife, because she will flirt; it is not good to marry an ugly wife, because she will not be attractive; therefore, it is not good to marry at all. The essential peculiarity of this reasoning is that it involves the principle of excluded middle, the falsity of which would leave ordinary syllogism intact. Logicians, however, have made the dilemma a matter of form of expression, saying that the above argument, for instance, is not a dilemma as long as the first premise reads as above, but that it becomes one if that premise is put in this form: If it is good to marry, it is good to marry a fair wife, or it is good to marry an ugly wife. They have at different times recognized the following forms as dilemmas or as parts of dilemmas, for many logicians hold that a dilemma consists of three syllogisms: (1) *Simple constructive dilemma*: If A, then C; if B, then C; but either B or A; hence, C. (2) *Simple destructive dilemma*: If A is true, B is true; if A is true, C is true; and C are not both true; hence, A is not true. (3) *Complex constructive dilemma*: If A, then B; if C, then D; but either A or C; hence, either B or D. (4) *Complex destructive dilemma*: If A is true, B is true; if C is true, D is true; but B and D are not both true; hence, A and C are not both true. The importance of the kind of reasoning now called *dilemma* was first strongly insisted upon by the Stoics. Nevertheless, in the Stoical terminology a *dilemma* is opposed to a *monolemma*, as a conclusion from two premises. This was the origin of the word, and it is only later that it is met with in the modern sense.

Dilemma is an argument made of two members, repugnant one to another, wherof whichsoever thou grantest, thou art by and by taken. *Blundeville, Logic, v. 27.*

Wordsworth, Deuturity Stanzas.

diluvianism (di- or di-lū'vi-an-izm), *n.* [*diluvian* + *-ism*.] A geological theory which is largely based on the supposition of the former occurrence of a universal deluge. In the early history of geology the deluge played an important part, and many leading facts were explained by reference to it.

Linguistic philology has been actually created by it [the scientific movement of the age] out of the crude observations and wild deductions of earlier times, as truly as chemistry out of alchemy, or geology out of *diluvianism*. *Whitney, Encyc. Brit., XVIII, 765.*

diluviate (di- or di-lū'vi-āt), *v. i.* [*L. diluviatus*, pp. of *diluviare*, overflow, deluge, < *diluvium*, a flood, deluge: see *diluvium*, and cf. *deluge*, *v.*] To overflow; run, as a flood.

E. *deluge*, *q. v.*), < *diluere*, wash away: see *dilute*.] **1.** A deluge or an inundation; an overflowing.—**2.** Coarsely detrital material, wherever found: a term introduced into geology in consequence of a general belief in the past occurrence of a universal deluge.

Finer materials, usually occupying the lower parts of valleys, and occurring especially along the courses of great rivers, were called *aluvium* (which see). In the use of the words *diluvium* and *aluvium* (*diluvial, aluvial*) there is an obscure recognition of a fundamental fact in geology, namely, that rivers have been gradually diminishing in volume, a condition which necessarily connects itself with diminished erosive power. But the idea of a catastrophic period of diluvial action, preceded and followed by repose, such as lies at the base of the belief in the deluge, is no longer in vogue, and the word *diluvium* has become almost obsolete except among German geologists.

dimaris, dimatis (dim'ā-ris, -tis), *n.* [An artificial term.] The mnemonic name of that mood of the fourth figure of syllogism which has affirmative propositions for its premises, one universal, the other particular. The oldest name for this mood seems to have been *Arimalis*, of which *dimatis* is an improvement, and *dimaris* is now most commonly in use. The following is an example of this mood: Some commendable actions are recognized by the political economists; but every action recognized by the economists is a selfish one; therefore, some selfish actions are commendable. The letters of the word have the following significations: *t*, *a*, and *i* show the quantity and quality of the propositions; *d*, that the reduction is to *daris*; *n*, that the premises are transposed in reduction; *s*, that the conclusion of the reduction is to be simply converted. See *A 1, 2 (b)*, and *conversion, 2*.

The dental formula is: 3 incisors in each upper, 2 in each lower half-jaw, 1 canine, 3 premolars, and 3 molars in each half-jaw. The type-species is *D. pilivestris*, having the general aspect of *Urotrichus talpoides*; tail vertebrae half the length of the head and body, soles and palms entirely scaly, and snout pilose. Sw. *dimension*, < L. *dimensio*(-n-), a measuring, extent, dimension, diameter or axis, < *dimetiri*, pp. *dimensus*, measure off, measure out (cf. pp. *dimetien*(-t)-s, as a noun, diameter), < *di-* for *dis-*, apart, + *metiri*, measure: see *measure*.] 1. Magnitude measured along a diameter; the measure through a body or closed figure along one of its principal axes; length, breadth, or thickness. Thus, a line has one dimension, length; a plane surface two, length and breadth; and a solid three, length, breadth, and thickness. The number of dimensions being equal to the number of principal axes, and that to the number of independent directions of extension, it has become usual, in mathematics, to express the number of ways of spread of a figure by saying that it has two, three, or *n* dimensions, although the idea of measurement is quite extraneous to the fact expressed. The word generally occurs in the plural, referring to length, breadth, and thickness.

So doe those skills, whose quick eyes doe explore
The just *dimension* both of earth and heaven.

Sir J. Davies, *Dancing*, st. 95.

Hence—2. A mode of linear magnitude involved (generally along with others) in the quantity to which it belongs. (a) In *alg.*, a variable factor, the number of dimensions of an expression being the number of variable factors in that term for which this number is the largest. (b) In *phys.*, a linear measure of length, time, mass, or any kind of quantity regarded as a fundamental factor of the quantity of which it is a dimension. If *M*, *L*, *T*, are the units of mass, length, and time, the *dimensions* of a velocity are said to be LT^{-1} , or one dimension of length and minus one of time; those of an acceleration are said to be LT^{-2} ; those of a momentum, MLT^{-1} ; those of a force, MLT^{-2} ; those of a quantity of energy, MLT^{-2} ; those of the action of a moving system, ML^2T^{-1} ; those of a horse-power, MLT^{-2} ; those of a pressure, $ML^{-1}T^{-2}$; those of a density, ML^{-3} ; etc.

This, however, is liable to lead to confusion, and is rare. (b) To cut off a part, as a half or nearly so, from any bearing. 2. Pertaining to dimorphism; exhibiting or characterized by dimorphism, in any sense of that word.

Dimorphic females among insects have been observed. . . . In these cases, as a rule, one of the female forms is more nearly related in form and color to the male, and in other cases the differences are more connected with climate and season, and also affect the male.

Claus, Zoology (trans.), I. 155.

dimorphism (di-mōr'fizm), *n.* [= F. *dimorphisme* = It. *dimorfismo*; as *dimorph* + *-ism*.] 1. The property of assuming or of existing under two distinct forms. Specifically—2. In crystal, the property of assuming two distinct crystalline forms not derivable from each other, as by crystallization. Thus, sulphur assumes one form when crystallizing at a high temperature, and another wholly different when becoming solid at the ordinary temperature. Hence, the same chemical substance may form two or more distinct mineral species. Carbon in one form is the diamond, in another graphite, etc.

According to the observation of Pasteur, instances of *dimorphism* usually occur when the two forms are nearly upon the limit of their respective systems.

W. A. Miller, Elem. of Chem., I. iii. § 4.

Dimorphism in Plants.

1. Submerged and floating leaves of *Cabomba*. 2. Disk- and ray-flowered of *Aster*.

of flowers or other parts upon the same plant, or upon plants of the same species.

Dimorphism in flowers may affect the perianth only, and not the ovary or essential organs; or there may be two kinds of flowers as respects these also, but with no reciprocal relations, as in cleistogamous *dimorphism*; or of two kinds essentially alike except in stamens and pistil, and these reciprocally adapted to each other, which is heterogamous *dimorphism*, or, when of three kinds, trimorphism. *A. Gray, Struct. Bot., p. 225.*

4. In zool., difference of form, structure, size, coloration, etc., between individuals of the same species. Sexual *dimorphism* is the rule in the animal

kingdom; and differences between the male and female other than in the sexual organs, as well as constant differences between individuals of each sex, without reference to sex, are instances of *dimorphism*.

Dimorphism is thus seen to be a specialized result of variation, by which new physiological phenomena have been developed. *A. R. Wallace, Nat. Select., p. 158.*

The phenomena of *dimorphism* and polymorphism in the same species, and the sexual differences which have been developed in animals originally hermaphrodite, may be quoted as important evidence of the extensive influence of adaptation. . . . The numerous cases of *dimorphism* and polymorphism in either sex of the same species should be regarded from the same point of view.

Claus, Zoology (trans.), I. 154.

5. In philol., the existence of a word under two or more forms called doublets; thus, *dent* and *dint*, *fat* and *vat*, *church* and *kirk*, exhibit *dimorphism* developed within English, and *card* and *chart*, *choir*, *quire*, and *chorus*, *reason*, *ration*, *ratio*, etc., exhibit *dimorphism* arising outside of English.

Where it [bifurcation] is produced by a foreign word coming into English in different ways, it has been called *dimorphism*: *ration, reason*.

F. A. March, Anglo-Saxon Grammar, p. 28.

Dimorphodon (di-mōr'fō-don), *n.* [NL., < Gr. *διμορφος*, of two forms (see *dimorph*), + *δόν*, Ionic form of *ὀδούς* (*ōdovt-*) = E. *tooth*.] A genus of extinct pterosaurian reptiles, or pterodactyls: so called from the fact that their teeth were of two kinds, the anterior long, the posterior mostly very short. The tail was long, and the other characters mostly as in *Rhamphorhynchus*; the metacarpus was comparatively short, and the end of the toothless jaws were probably sheathed in horn.

dimorphous (di-mōr'fus), *a.* [NL. *dimorphus*, < Gr. *διμορφος*, having two forms: see *dimorph*.] Existing in two forms; dimorphic: specifically applied in crystallography to a substance whose crystals occur in two distinct forms. Thus, calcium carbonate crystallizes in the rhombohedral form as calcite, and in the orthorhombic as aragonite. See *dimorphism*.

Bodies capable of . . . assuming two forms geometrically incompatible are said to be *dimorphous*.

W. A. Miller, Elem. of Chem., I. iii. § 4.

It is not unlikely that the Guinea worm, . . . which infests the integument of Man in hot climates, may answer to the hermaphrodite state of a similarly *dimorphous* Nematoid. *Huxley, Anat. Invert., p. 552.*

In Stein's system of classification (1878), a family of flagellate infusorians, represented by the genera *Dinobryon* and *Epipyxis*.

Dinobryon (di-nob'ri-on), *n.* [NL., *<* Gr. *δίνος*, a whirling, a round area, + *βρίων*, seaweed, tree-moss, lichen.] A genus of collar-bearing monads or flagellate infusorians, type of the family *Dinobryidae*. These animalcules inhabit fresh water. They are biflagellate, with one long and one short flagellum, attached by a posterior contractile ligament within the individual cells or lorice of a compound branching polythecium, built up by successive terminal gemination of zooids. The endoplasm contains two lateral color-bands and usually an anterior pigment-spot like an eye. The best-known species is *D. sertularia*. Also written *Dinobryum*. Ehrenberg, 1834.

Dinoceras (di-nos'e-ras), *n.* [NL., *<* Gr. *δεινός*, terrible, mighty, + *κέρας*, horn.] One of the genera of the *Dinocerata*, giving name to the group: so called from the extraordinary protuberances of the skull, representing three pairs of horn-cores. The species, as *D. mirabile*, *D. laticeps*, were huge ungulates, with 5-toed feet and 3 pairs of horns, 6 molars,

The name was given because the structure before regarded as a girdle of cilia seemed to be a second flagellum lying in the transverse groove which nearly all these infusorians possess in addition to the longitudinal one. The *Dinoflagellata* are named as a class, and divided into *Adinida* and *Dinifera*. Bütschli.

Museum of Natural History, New York.

The typical and only genus of the extinct family *Dinornithidae*. Numerous species, as *D. giganteus*, *D. elephantopus*, etc., have been described by Owen, differing much in size; the largest must have stood about 14 feet high, and had thigh-bones stouter than those of a horse. The general figure of these huge flightless birds was like that of the ostrich, but the size was much greater, and the legs were both relatively and absolutely much stouter. See *moa*.

Dinornithidae (dī-nōr-nith'i-dē), *n. pl.* [NL., < *Dinornis* (-ornith-) + *-idae*.] A family of gigantic extinct ratite birds of New Zealand; the moas. They were characterized by an enormous development of the legs and pelvis in comparison with the rest of the skeleton, a ratite or flat sternum, and rudimentary wings. The extinction of the group is quite recent, since portions of the soft parts have been found, and traditions are current respecting the living birds; but the period to which they arrived is not exactly known. See *moa*.

Dinornithoidea (dī-nōr-ni-thoi'dē-ē), *n. pl.* [NL., < *Dinornis* (-ornith-) + *-oidea*.] A superfamily of birds: same as *Dinornithes* or *Immanes*.

dinosaur (dī'nō-sār), *n.* One of the *Dinosauria*. Also spelled *deinosaur*.

Dinosauria (dī-nō-sā'ri-ā), *n. pl.* [NL., less prop. *Deinosauria*, < *Dinosaurus*, *q. v.*] A group of extinct Mesozoic reptiles, mostly of gigantic or colossal size. They were characterized by distinctly socketed teeth; generally flat or slightly cupped vertebrae, some of which were opisthocœlous; and a sacrum of four or more vertebrae; numerous caudal vertebrae; a structure of the skull in many respects intermediate between the crocodilian and lacertilian types; ambulatory or saltatory limbs; fore limbs reduced and not known to have had clavicles; and hind limbs usually disproportionately developed, and with the pelvis presenting a series of modifications tending toward the characters of birds, on which account the group is also called *Ornithoscelidia* (which see). The ornithic structure of the legs is best seen in the smaller genera, such as *Compsognathus*; it is exhibited in the presence of a cœmial crest, the reduction of the distal end of the fibula, the disposition of the distal end of the tibia, and the relations of the astragalus. In some genera there was a bony dermal armor, in some cases developing great spines. The *Dinosauria* were a polymorphic as well as an extensive group, the limits of which are not settled, owing to the wide range of variation presented by them. They ranged in size from that of the huge iguanodon down to about two feet. By some they are supposed to have included the remote ancestors of birds; others find in them features that recall mammals, especially pachyderms. The order is by some divided into *Dinosauria* proper and *Compsognathia* (which see); it is sometimes ranked as a subclass of *Reptilia*, and divided into *Sauropoda*, *Stegosauria*, *Ornithopoda*, *Theropoda*, and *Hallopoda*.

It had (?) incisors in the upper and 2 in the lower jaw, no canines, 2 premolars and 3 molars in each half of each jaw—all in position at once, the premolars replacing milk molars as usual in diphyodont mammals—and enormous lower incisors, turned down or away from the mouth, the end of the under jaw being modified to correspond. There are several species, from the Miocene of Europe and Asia, the best-known of which is *D. giganteum*, from Eppelsheim near Mainz, estimated to have been about 18 feet long.

ida. It has a rosette of root-leaves, from which rises a naked scape bearing a corymb of rather large white flowers. The leaves have a dilated petiole and a slightly stalked 2-lobed lamina or appendage with three very delicate hairs and a fringe of stout marginal bristles on each lobe. The hairs are remarkably irritable, and when touched by a fly or other insect the lobes of the leaf suddenly close on the insect and capture it. This is followed by the copious secretion of an acid liquid for the digestion of the prey, and by its absorption. This may be repeated several times by the same leaf.

The most important of these festivals, in the historic period, were those of Attica, which were four in number, celebrated annually: the *Rural* or *Lesser Dionysia*, the *Lenæia*, the *Anthesteria*, and the *Dionysia in the City*, or *Greater Dionysia*. The *Lesser Dionysia* were a vintage-festival, celebrated through the rural demes in the month of Poseideon (December), with universal merriment and freedom from restraint, extended even to slaves. Plays were performed during this festival, and from its characteristic songs and jests comedy was developed. The *Greater Dionysia* were observed at Athens in the second half of March, with a grand procession, a set chorus of boys, and the production in competition at the expense of the state, in the *Dionysiac theater*, in honor of the god, of the comedies and tragedies of which those surviving constitute our most precious treasures of ancient literature. See *Bacchus*, *Lenæia*, *Anthesteria*, *choragic*, and *choragus*.

Dionysiac (dī-ō-nis'i-ak), *a.* [*l. c.*] (*Dionysia*, < Gr. *Διονυσιακός*, < *Διονυσία*, *Dionysia*: see *Dionysia*, *Dionysus*.) In *Gr. myth.*, of or pertaining to the festivals called *Dionysia*, in honor of *Dionysus* or *Bacchus*, the god of wine; *Bacchie*.

Dionysian (dī-ō-nis'i-an), *a.* [*l. c.*] (< Gr. *Διονυσιακός*, pertaining to *Dionysus* (as a proper name, *L. Dionysius*), < *Διόνυσος*, *Dionysus*: see *Dionysus*.) 1. Same as *Dionysiac*.

2. Pertaining to or characteristic of *Dionysus* the Elder or *Dionysus* the Younger, tyrants of Syracuse (about 405–343 B. C.), both notorious for cruelty, but especially the former.

He . . . [Francis] lived a life of republican simplicity, and published with *Dionysian* severity the slightest want of respect. *Encyc. Brit.*, IX. 688.

3. Pertaining to the abbot *Dionysius Exiguus*, who, in the sixth century, introduced the present vulgar reckoning of the years.—*Dionysian period*, a period of 532 Julian years, at the end of which full moons fall on the same days of the year. Diōn (dī-ō'on), *n.* [NL., < Gr. *δι-*, two-, + *ὄν* = *L. ovum*, an egg.] A cyæadaceous genus of plants, of which there are only two species, natives of tropical Mexico. The stem is very short and stout, with a crown of large, rigid, and spine-tipped pinnate leaves. The female cone is of the size of a child's head, each scale bearing two seeds as large as chestnuts. The seeds of *D. edule* yield a kind of arrowroot. Also *Dion*.

Diōnites (dī-ō-ō-ni'tēz), *n.* [NL., < *Diōn* + *-ites*.] The generic name of a fossil plant belonging to the cyæads, occurring in numerous localities in the Triassic and Jurassic of Europe. The genus *Diōnites*, as instituted by Bornemann, consists largely of species previously assigned by authors to *Pterophyllum*.

Diophantine (dī-ō-fan'tin), *a.* [*l. c.*] (*Diophantus*, Gr. *Διόφαντος*, a proper name, + *-inē*.) Of or pertaining to *Diophantus* of Alexandria, a celebrated Greek arithmetician, who flourished in the fourth century.—*Diophantine analysis*, indeterminate analysis: a method of solving *Diophantine* problems, namely, of solving indeterminate algebraic equations, the solutions being rational numbers. The method consists in introducing an equation involving an indeterminate coefficient, in such a way that the square of one of the unknowns may be eliminated. It therefore depends upon the ingenuity and experience of the calculator. The following is an example: Required to separate a given square number, N^2 , into the sum of two squares. Let x^2 be one of these squares, and let the root of the other be $ax - N$, where a is indeterminate. Then, the sum of the two squares will be $(1 + a^2)x^2 - 2aNx + N^2$. Since this is equal to N^2 , we have $(1 + a^2)x = 2aN$, or $x = 2aN / (1 + a^2)$, which is rational.

It occurs in prismatic crystals, of a vitreous luster, and of a pale-green or a greenish- or yellowish-white color. Fine specimens come from the Mussa Alp, in the Ala valley in Piedmont. Also called *albite* and *musite*.

Diopsis (di-op'sis), *n.* [NL., < Gr. *di-*, two-, + *ὄψις*, view. Cf. *diopside*.] 1. In *entom.*, a genus of dipterous insects, of the family *Muscidae*, or flies. Dioptric system, in lighthouses, a mode of lighting in which the illumination is produced by a central lamp, the rays from which are transmitted through a combination of lenses surrounding it. Also called the *refracting system*.

Section of Fresnel's Dioptric Light.

II. *n.* A unit of refractive power of a lens (or inverse focal length), equal to unity divided by a meter. The numerical measure of the power of a lens expressed in dioptries is the ratio of one meter to the focal length of the lens, the latter being measured positively in the direction away from the source of parallel rays entering the lens; so that a convex lens with a focal length of half a meter would have a power of 2 dioptries, and a concave lens with a focal length of 250 millimeters would have a power of -4 dioptries.

Owing principally to differences in the length of the inch in various countries, this method [the inch being used as the unit] had great inconveniences, and is now giving place to a universal system, in which the unit is the refractive power of a lens whose focal length is one metre. This unit is called a *dioptric* (usually written "D"). *Encyc. Brit.*, XXII. 373.

dioptrical (di-op'tri-kal), *a.* Same as *dioptric*.
dioptrically (di-op'tri-kal-i), *adv.* By refraction.

And now that it has been shown that these images are not formed *dioptrically*, but are the result of numerous "diffraction-spectra," it is impossible to entertain the same confidence as before. *W. B. Carpenter*, *Micros.*, § 277.

dioptrics (di-op'triks), *n.* [Pl. of *dioptric* (see *-ics*), after Gr. τὰ *διοπτρικά*, the science of dioptries.] That part of optics which treats of the refraction of light passing through different media, as air, water, or glass, and especially through lenses. The term is now not much used by scientific writers, the phenomena to which it refers being treated under the general head of *refraction* (which see). See also *lens*, *light*, and *optics*. Also called *anaclastics*.

diorama (di-ō-rā'mā), *n.* [< Gr. as if **διόραμα*, < *διόρα*, see through, < *διά*, through, + *ὄρα*, see. Cf. *panorama*.] 1. A spectacular painting, or a connected series of paintings, intended for exhibition to spectators in a darkened room, in a manner to produce by optical illusions an appearance of reality. The paintings are so executed and arranged that a variety of effects may be induced by varying the direction, intensity, and color of the light; one of the most notable of these effects coming from light transmitted through the picture itself, which is painted in transparent coloring on a thin fabric. Different scenes may be painted on the two faces of the fabric, and a change from one to the other may be made by altering the source of the illumination. A daylight scene may be thus changed with wonderful realism to one by moonlight, or a desert place may become all at once peopled by a busy crowd. The diorama was devised in 1822 by Daguerre (the chief inventor of photography) and Bouton. 2. A building in which dioramic paintings are exhibited.

diorite (di-ō-rit'), *n.* [So called because formed of distinct portions; irreg. < Gr. *διωρίζω*, separate, distinguish (see *diorism*), + *-ιτε*.] The name given by Haüy to a rock included among those varieties which had before that time been generally designated by the name *granite-stone*. Diorite consists essentially of a crystalline-granular aggregate of a triclinic feldspar and hornblende, in very varying proportions, with which are frequently associated magnetite and apatite, and sometimes mica. This rock has usually a thoroughly crystalline structure. Many of the rocks called by the name of *diorite* are, in all probability, altered basalts; some, however, may have resulted from the alteration of andesites, and even of gabbros. In the case of diorite, the alteration has proceeded further than it has in the diabases and melaphyres. See *greenstone* and *diabase*.

At a comparatively late date the Dioscuri were partly confuted with the Cabiri.

To the *Dioscuri*, who always retained very much of their divine nature, belongs a perfectly unblemished youthful beauty, an equally slender and powerful shape, and, as an almost never-failing attribute, the half-oval form of the hat, or at least hair lying close at the back of the head, but projecting in thick curls around the forehead and temples. *C. Flower and Fruit of *Diospyros Virginiana*.

Of the 150 species, only two are American, of which one is the common persimmon of the United States, *D. virginiana*, sometimes called *date-plum*. Kaki*, the Chinese or Japanese persimmon, is cultivated for its fruit, which resembles the plum in appearance and flavor, and has been introduced into southern Europe and the United States. *D. Lotus* of southern Europe has been supposed to be the lotus of the ancients, but its fruit is hardly eatable. It is used as a remedy for diarrhea. The fruits of most of the species are excessively astringent when immature, owing to the amount of tannic acid which they contain.

It is not infrequently followed by more or less extended paralysis. The air-passages of the head are the most frequent seat of the diphtheritic membrane, although it may appear on other mucous surfaces and in wounds. The disease is very frequently fatal, and its ravages are extended by filth. Also *diphtheritis*.

Diphtheria is not an hereditary disease; but a special aptitude to receive and heredity the poison evidently pertains to certain individuals and families.

diphthong (dif' - or dip'thōng), *n.* [Formerly also *diphthong*; = *F. diphthongue* = *Pr. diptongo* = *Sp. diptongo* = *Pg. diphthongo*, *ditongo* = *It. ditongo* = *D. diphthongus* = *G. diphthong* = *Dan. Sv. diftong*, *<* L.L. *diphthongus*, *<* Gr. *διφθόγγος*, also *διφθόγγον*, a diphthong, fem. and neut. respectively of *διφθόγγος*, with two sounds, *<* *δι-*, two-, + *φθόγγος*, voice, sound, *<* *φθέγγεσθαι*, utter a sound.] A coalition or union of two vowels pronounced in one syllable. In uttering a proper diphthong both vowels are pronounced; the sound is not simple, but the two sounds are so blended as to be considered as forming one syllable, as in *joy*, *noise*, *bound*, *out*. An "improper" diphthong is not a diphthong at all, being merely a collocation of two or more vowels in the same syllable, of which only one is sounded, as *ea* in *breach*, *eo* in *people*, *ai* in *rain*, *eau* in *beau*. (See *digraph*.) In Greek grammar, a proper diphthong is a diphthong the first vowel of which is short; an improper diphthong, a diphthong the first vowel of which is long. The proper diphthongs are *αι*, *οι*, *ου*, *ευ*, *ου*; the improper, *αι*, *η*, *ω* (commonly written *η*, *η*, *ω*; see *iota subscript*, under *subscript*), *ηυ*, *ου*. An improper diphthong not usually distinguished as such is *αυ*, as in *αυτός*, *Επικ* *αυτός*. Some include *υ* in this class, and some limit the term to *η*, *η*, *ω*.

Whether there were any true diphthongs in Old-English, and if not, when they were introduced, is a question which cannot now be answered.

G. P. Marsh, Lects. on Eng. Lang., xxii.

Whatever the condition of the extreme end of the spine of a fish, it occasionally retains the same direction as the trunk part, but is far more generally bent up. . . . In the former case, the extremity of the spine divides the caudal fin-rays into two nearly equal moieties, an upper and a lower, and the fish is said to be *diphycercal*.

Gegenbaur, Comp. Anat. (trans.), p. 552.

II. n. A mammal which has two sets of teeth. Most mammals have a definite set of milk-teeth which are deciduous, and are displaced and replaced by a permanent set. The latter, as a rule, differ both numerically and otherwise from the former, particularly in the appearance of true molars, which are lacking in the milk-dentition. Thus, in a child there are 20 teeth, none of them molars proper; in the adult there are 32, an increase of three molars above and below on each side.

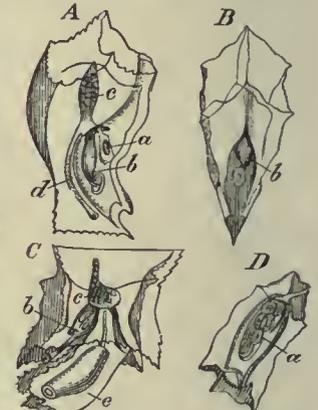

diphyzooid (dif'i-pō-zō'oid), *n.* Same as *diphyzooid*.

diphysite (dif'i-sīt), *n.* [*<* Gr. *δι-*, two-, + *φύσις*, nature, + *-ite*².] One who held the doctrine of diphysitism. Also improperly *diphysite*.

diphysitism (dif'i-sī-tizm), *n.* [*<* *diphysite* + *-ism*.] In *theol.*, the doctrine of two distinct natures in Christ, a divine and a human, as opposed to *monophysitism*. The distal set of appendages [in the calycophorans] is the oldest, and, as they attain their full development, each set becomes detached, as a free-swimming complex *Diphyzooid*. In this condition they grow and alter their form and size so much that they were formerly regarded as distinct genera of what were termed monogastric *Diphydæ*.

A, B, Diphyzooid (*Sphenoides*), lateral and front views. *C*, Diphyzooid of *Abyla* (*Cuboides*): *a, c*, gonophore, or reproductive organ; *b*, hydranth; *c*, phyllocyst, with its process, *d*. *D*, Free Gonophore, its manubrium, *a*, containing avia. (All enlarged.)

being twice active, with an intervening period of rest. It occurs in the zoospores of certain genera of *Saprolegnia*, in which the zoospores escape without cilia from the aporangium, and come to rest in a cluster, each forming a cell-wall. After some hours of rest the protoplasm of each spore escapes from its cell-wall, acquires cilia, and enters upon a period of active movement.

dipplantidian (dip-lan-tid'i-an), *a.* [*Gr.* διπλόος, double, + ὑπί, against, + εἶδος, form, image.] Showing two images, one reversed and the other direct: applied to a telescope proposed in 1778 by Jeurat, to be used in taking transits, the coincidence of the two images serving in place of a transit over an illuminated wire. diparthrism (dip-lār'thrizm), *n.* [*Gr.* διπάρθρ-ος + -ισμ.] The quality or condition of being diplarthrous; the alternation of the several bones of one row of carpals or tarsals with those of the other row respectively, instead of that linear arrangement of the respective bones of both rows which constitutes taxeopody (which see): so called because each bone of one row interlocks with two bones of the other row.

Diplarthrism appears in that foot before it does in the fore foot, as in the Proboscidea.

E. D. Cope, Amer. Nat., XXI. 988.

diparthrous (dip-lār'thrus), *a.* [*Gr.* διπάρθρ-ος, *Gr.* διπλόος, double, + ἄρθρον, joint.] Doubly articulated, as a bone of one row of carpal or tarsal bones with two bones of the other row; characterized by or exhibiting diplarthrism; not taxeopodous: as, a *diparthrous* carpus or tarsus; a *diparthrous* ungulate mammal.

The diphasic class of feet comprises those feet in which the thesis or metrically accented part (called by many the arsis) has double the length of the arsis or metrically unaccented part (called by many the thesis). The diphasic feet are (1) the trisemic feet (equal to 2/3 | - or - | 2/3 -), the tribrach, trochee, and iambus, and (2) the hexasemic feet (equal to 2/3 - | - or - | 2/3 -), the Ionic a minore, the Ionic a minore, Molesus, and choriamb.

contractions, contractions which, when the anode of a galvanic current is applied to the mastoid process and the large cathode is placed between the shoulder-blades, have in some cases been seen in the muscles of the arm on the side opposite that to which the anode is applied.

dipleidoscope (di-plī'dō-skōp), *n.* [Irreg. *Gr.* διπλέιδος, double, + εἶδος, appearance, + σκοπεῖν, view.] An instrument for indicating the passage of the sun or a star over the meridian by the coincidence of two images of the object, the one formed by single and the other by double reflection. It consists of an equilateral hollow prism, two of whose sides are silvered on the inside so as to be mirrors, while the third is formed of glass. The prism is adjusted so that one of the silvered sides shall be exactly in the plane of the meridian, and the transparent side toward the object. So long as the object has not reached the meridian, the image produced by that portion of the rays reflected directly from the glass surface, and that produced by the rays transmitted through the glass to the silvered side, reflected from it to the other, and thence through the glass, are not coincident, but gradually approach as the sun or star approaches the meridian, until they exactly coincide at the instant the center of the object is on the meridian; then an eye stationed at the side of the prism and looking toward the transparent side sees only one object.

Dipleura (dī-plō'rā), *n. pl.* [NL., neut. pl. of **dipleurus*, *Gr.* δι-, two-, + πλευρά, side. Cf. *dipleuric*.] In *morphol.*, those organic forms which are dipleural: distinguished from *Tetrapleura*.

diplex (dī'pleks), *a.* [*Gr.* δι-, two-, + πλεξ, as in *duplex*; a distinctive var. of *duplex*.] Double: applied to a method of transmitting two messages in the same direction and at the same time over a single telegraph-line.

The terms *contraplex* and *diplex* are here applied as specific names for designating clearly the way in which the particular simultaneous double transmission to which we wish to refer is effected. Thus, for instance, two messages may be sent over a single wire in the same or in opposite directions, and when we do not care to particularize either, we simply allude to them under the more common generic name of duplex transmission, which includes both. When, however, we wish to speak of either method by itself, we use the term *diplex* for simultaneous transmission in the same direction, and *contraplex* for that in opposite directions.

G. B. Prescott, Elect. Invent., p. 246.

See *cuta* under *Lepidosiren* and *mudfish*. 2. A division of holothurians, of the order *Pneumonophora*, having two ramose branchiæ: opposed to *Apneumona*. It contains the branchiate holothurians, excepting *Rhopalodina*.

Dipneumoneæ (dip-nū-mō'nē-ä), *n. pl.* [NL., as *Dipneumones* + *-æ*.] Same as *Dipneumones*, 2.

In Haeckel's classification, a division of the *Dipneusta*, or *Dipnoi*, containing those dipnoans which are double-lunged, namely, *Protopterus* and *Lepidosiren*: distinguished from *Monopneumones*. — 2. In *entom.*, a division of *Araneida* or true spiders, having but two lungs, six spinnerets, and scattered ocelli: distinguished from *Tetraneumones*. Most spiders belong to this division. Also *Dipneumonæ*.

(b) Having two lungs, as a lung-fish; specifically, having the characters of the *Dipneumona*. (c) Having a pair of respiratory organs, as a holothurian; pertaining to such branchiate *Holothurioidea*.

II. *n.* One of the *Dipnoi*; a lung-fish.

Dipnoi (dip'nō-i), *n. pl.* [NL., pl. of *dipnous*, doubly breathing: see *dipnoous*.] A subclass of fishes, by some considered to be a peculiar class of vertebrates intermediate between fishes and batrachians, and by others an order of fishes (by some ranked as a suborder of ganoid fishes), containing the lung-fishes of the genera *Lepidosiren* and *Protopterus* (*Dipneumona*) and *Ce-*

ratodus (*Monopneumona*), and many extinct relatives. They have both branchial and pulmonary respiration, whence the name; no distinct suspensorium is developed, but the lower jaw articulates directly with descending processes of the cranium; there is a median pelvic element; and the limbs are multiradiate. The skeleton is partially osseous, with persistent notochord; the heart has two auricles and one ventricle; there is a muscular conus arteriosus and spiral intestinal valva; the gills are free, with a narrow opening and rudimentary gill-cover; and the air-bladder is nearly or quite double, and developed into functional lungs permanently communicating with the esophagus. The body is covered with cycloid scales. The living *Dipnoi* are divisible into two groups, *Dipneumona* with paired lungs, and *Monopneumona* with a single lung of two asymmetrical halves. Some old extinct relations are referred to another order (or suborder) called *Ctenodipterini*, by others endowed with the rank of a family only. See *barramunda*, *Ceratodidæ*, *Ctenodipterini*, *Dipteridæ*, *Lepidosirenidæ*, *mudfish*, and *Sirenoidæ*. Also called *Diploptnoi*, *Dipneusta*, *Dipneusti*, *Dipnoa*.

It is a remarkable circumstance, that while the *Dipnoi* present in so many respects a transition between the piscine and the amphibian types of structure, the apical column and the limbs should be not only piscine, but more nearly related to those of the most ancient Cross-sporterygian Ganoids than to those of any other fishes.

Huxley, *Anat. Vert.*, p. 148.

The American dipper is a similar but distinct species, *C. mexicanus*, entirely dark-colored when adult. There are in all about 12 species of dippers, mostly inhabiting clear mountain-streams of various parts of the world. They belong to the turdiform group of oscine *Passeres*, in the vicinity of the thrushes, and are notable as the only thoroughly aquatic passerine birds. Diptera (dip'te-rā), *n. pl.* [NL., neut. pl. of *dipterus*, two-winged: see *dipteros*.] 1. An order of metabolous hexapod insects. They are two-winged insects, or flies, with two membranous wings with radiating nervures, not folded at rest, a posterior pair being only represented by halteres or poisers; no mandibles as such, but a suctorial proboscis instead, formed of modified mandibles, maxilla, and the central labium, here called glossarium; usually two maxillary but no labial palpi; antennæ generally short; two large compound eyes, often of thousands of facets, and three ocelli or simple eyes; and the prothorax and metathorax reduced, the mesothorax being correspondingly developed. Metamorphosis is complete; the larvæ are apodal, or with only rudimentary feet; the pupæ are usually coarctate (see cut under *coarctate*), sometimes obtected. The common house-fly, blue-bottle, etc., are characteristic examples. The power which many of these insects have of walking on smooth surfaces with back downward is due to the construction of the feet, which act as suckers. They have, besides the ordinary two claws, several little cushions called pulvilli, beset with fine hairs expanded at their tips into a kind of disk; the adhesion is aided in some cases by a viscid secretion of these hairs. The order is a very large one: there are said to be 9,000 European species alone, supposed to be not a twentieth part of the whole number. About 4,000 are described as North American. A few are useful scavengers, but many are injurious insects, and some are great pests. Gnats, mosquitos, gad-flies, blow-flies, bot-flies, tsetzes, etc., belong to this order. It is variously subdivided, one division being into four suborders: the *Pupipara*, which are parasitic, and developed in the body of the parent, as the bee-lice, the *Brachycera*, or ordinary flies; the *Nemocera*, or crane-flies, gnats, midges, mosquitos, etc.; and the wingless *Aphaniptera*, or fleas, which are oftener ranked as a

distinct order. Another division is into the suborders *Orthorhapha* and *Cyclorhapha*, according to the character of the metamorphosis: the former with two sections, *Nematocera* and *Brachycera*; the latter with also two sections, *Achizta* and *Schizophora*.

(c) The intercessions in the course of which these names were introduced. The recitation of the name of any prelate or civil ruler in the diptycha was a recognition of his orthodoxy; its omission, the reverse. The mention of a person after death recognized him as having died in the communion of the church, and the introduction of his name into the list of saints or martyrs constituted canonization. In liturgies the diptychs are distinguished as the *diptychs of the living* and the *diptychs of the dead*, the latter including also the commemoration of the saints. In most liturgies the diptychs are included in the *great intercession* (see *intercession*). direct-action (di-rekt'ak'shon), *a.* In mech., characterized by direct action: a term applied to engines which have the piston-rod or cross-head connected directly to, or by a connecting-rod with, the crank, dispensing with working-beams and side levers: as, a direct-action steam-engine. A rectilinear motion of the piston is insured by a cross-head at the end of the piston-rod, which slides in parallel guides, or, in the case of the oscillating engine, the cylinder vibrates in accordance with the movement of the crank. Special types of direct-action engines are the annular double-cylinder, double-piston, inclined-cylinder, inverted-cylinder, oscillating, sliding-cover, steep-le, and trunk-engines. Also applied to steam-pumps which have the steam-piston connected by the piston-rod directly to the pump-piston or plunger, and which have valve-gear that prevents stopping on what is called the dead-center. Such pumps work without cranks or fly-wheels.

Sw. direction, < L. directio(n)-, a making straight, a straight line, a directing (toward anything), < dirigere, pp. directus, direct: see direct.*] 1. Relative position considered without regard to linear distance. The direction of a point, A, from another point, B, is or is not the same as the direction of a point, C, from another point, D, according as a straight line drawn from B through A and continued to infinity would or would not cut the celestial sphere at the same point as a straight line drawn from D through C and also continued to infinity. Every motion of a point has a determinate direction; for if any motion from any instant were to lose all curvature, it would tend toward a determinate point of the celestial sphere, which would define its direction at the instant when it ceased to be deflected. It is inaccurate to say that a line has a determinate direction, because a motion along that line has either one of two opposite directions. Yet the word *direction* is sometimes used in a loose sense in which, opposite directions not being distinguished, the direction of a line is spoken of, meaning the pair of opposite directions.

The direction of a star is seen at a glance, while the most profound science and the most accurate observations have not enabled the astronomer to ascertain its distance.

In the dragon-flies they are exterior to the triangle; in the *Aphides* they are the cells limited by the oblique nervures; and in the *Hymenoptera* they are two or three cells near the center of the wing, between the cubital and anal nervures.—**Discoidal cleavage, egg-cleavage, or segmentation of the vitellus**, one of several forms of cleavage distinguished by *Haeckel*. It occurs in meroblastic eggs, or those in which there is a large quantity of food-yolk or nutritive protoplasm in comparison with the small amount of germ-yolk or formative protoplasm. It occurs in all birds' eggs, in which the round, flat germ-disk, commonly called the *blastula* or *tread*, may be observed upon the surface of the yolk. In impregnated eggs, even when freshly laid, the germ-disk may be resolved by moderate magnifying power into a flattened mass of little cells which have already arisen by this form of cleavage of the original parent-cell or discocytula, and have become a discomerula, or even advanced to the stage of a discoblastula or discogastrula.—**Discoidal epipleura**, in *entom.*, borders of the elytra which are strongly deflexed, appearing like processes of the lower surface of the disk. *Kirby*.—**Discoidal nervures**, in *entom.*, the nervures in the center of the wing, entirely unconnected with other nervures, as in certain *Coleoptera*.—**Discoidal placenta**, a placenta or afterbirth, which has the form of a circular flattened cake, as that of man, monkeys, bats, insectivores, and the rodents.

Discomedusæ (dis'kō-mē-dū'sē), *n. pl.* [NL., *pl. of Discomedusa*.] An order of the class *Hydrozoa* and subclass *Scyphomedusa*, including the discophorous hydrozoans, or *Discophora* in a strict sense, as those aculephs commonly called jelly-fishes: so called from the large umbrella-like disk which these organisms possess. Most jelly-fishes belong to this order. They are technically characterized as *Scyphomedusæ* which develop as actual medusiform individuals by transverse fission from a scyphotoma (which see), or else directly from the egg; with 4 perisidal, 4 interradial, and sometimes accessory adradial tentaculocysts; 4 or 8 genital lobes developed from the endoderm forming the oral floor of the enteric cavity, which is extended into 4 or 8 pouches; and with the mouth either opening simply at the end of a rudimentary manubrium or provided with 4 or 8 arm-like processes. According to the character of the tentacles, the *Discomedusæ* are divided into three suborders, *Cubatomæ*, *Semostomæ*, and *Rhizotomæ*. To the last of these belong the genera *Cephea*. (See cut under *Discophora*.) The order as here defined is contrasted with the three orders *Lusernaria*, *Conomedusæ*, and *Peromedusæ*, and is included with them in the subclass *Scyphomedusæ*. Characteristic genera of discomedusans are *Discomedusa* and *Nautilothoe* among the simple cubetomous forms; the semostomous *Chrysaora*, *Pelagia*, *Cyanea*, and *Aurelia*; and the rhizotomous *Cephea*, *Cassiopaia*, and *Rhizotoma*. The term *Discomedusæ* has also been wrongly extended to other scyphomedusans, thus becoming synonymous with the subclass *Scyphomedusæ*, or with *Discophora* in one of its senses.

3. In *math.* See the extract.

The term *discontinuos*, as applied to a function of a single variable, has been used in two totally different senses. Sometimes a function is called *discontinuos* when its algebraic expression for values of the variable lying between certain limits is different from its algebraic expression for values of the variable lying between other limits. Sometimes a function of x , $f(x)$, is called continuous when, for all values of x , the difference between $f(x)$ and $f(x+h)$ can be made smaller than any assignable quantity by sufficiently diminishing h , and in the contrary case *discontinuos*. If $f(x)$ can become infinite for a finite value of x , it will be convenient to consider it as *discontinuos* according to the second definition. Stokes.

Continual drinking is most convenient to the distemper of an hydroptic body, though most *disconvenient* to its present welfare. Ep. Reynolds, On the Passions, xl.

Discophora (dis-kof'ō-rā), *n. pl.* [NL., neut. pl. of *discophorus*: see *discophorous*.] 1. The discoidal hydrozoans, a subclass of *Hydrozoa*, comprising most of the organisms known as jelly-fishes, sea-jellies, or sea-nettles. The latter name is given them from the power they possess, like other hydrozoans, of stinging by means of their thread-cells. The hydrosome consists of a single umbrella-like disk, by the rhythmical contraction of which the creature swims, and from the center of which hangs a single polypite or digestive individual, or, less frequently, several. They are free-swimming oceanic animals, whose body consists of such soft gelatinous substance that a specimen weighing several pounds when alive weighs when dried hardly as many grains. The *Discophora* include many aclephes, in the usual sense of that term, and are also called *Medusæ*, *Ephyromedusæ*, and *Aceraspæda*. They have been divided into *Calycozoa* (Lucernarians), *Rhizostomea*, and *Monostomea*. The term *Discophora* is also restricted to the last two of these, excluding the *Lucernaria*. Thus, by Claus, the *Discophora* are made a suborder of *Scyphomedusæ*, synonymous with *Aceraspæda*, and characterized as disk-shaped aclephes with the margin of the disk 8-lobed, at least 8 submarginal sense-organs, as many ocular lobes, and 4 great cavities in the umbrella for the generative organs. In this strict sense the *Discophora* correspond to the *Discomedusæ* (which see). For several wider and inconsistent uses of the term, see the extract.

The binary division of the *Hydrozoa* was established by Eschscholtz (1829), whose *Discophoræ phanero-carpeæ* correspond to the *Scyphomedusæ*, whilst his *Discophoræ cryptocarpeæ* represent the *Hydromedusæ*. The terms point to distinctions which are not valid. In 1853 Kölliker used the term *Discophora* for the *Scyphomedusæ* alone, an illegitimate limitation of the term which was followed by Louis Agassiz in 1860. Nicholson has used the term in a reverse sense for a heterogeneous assemblage of those medusæ not classified by Huxley as *Lucernariæ*, nor yet recognized as derived from hydroid trophosomes. This use of the term adds to the existing confusion, and renders its abandonment necessary. . . . The term *Discophora* is used by Claus for the *Discomedusæ*. Encyc. Brit., XII. 556.

discount (dis'kount), *n.* [= OF. *descompte*, F. *décompte* = Sp. *descuento* = Pg. *desconto* = It. *sconto*, formerly *disconto* (> D. G. *disconto* = Dan. *diskonto* = Sw. *diskont*), *<* ML. *discomptus*, discount; from the verb: see *discount*, v.] 1. An allowance or deduction, generally of so much per cent., made for prepayment or for prompt payment of a bill or account; a sum deducted, in consideration of cash payment, from the price of a thing usually sold on credit; any deduction from the customary price, or from a sum due or to be due at a future time.—2. In *finance*, the rate per cent. deducted from the face value of a promissory note, bill of exchange, etc., when purchasing the privilege of collecting its amount at maturity. *Bank discount* is simple interest paid in advance, and reckoned, not on the sum advanced in the purchase, but on the amount of the note or bill. This is the method recognized in business and in law. *True discount* is a technical term for the sum which would, if invested at the same rate, amount to the interest on the face value of the note or bill when due: thus, \$5 is the bank discount at the rate of 5 per cent. on a bill drawn at twelve months for \$100; while \$4.7619 is the true discount, because that sum if invested at 5 per cent. would at the end of a year amount to \$5. True discount may be found by multiplying the amount of a bill or note by the rate of discount and dividing by 100 increased by the rate; while bank discount is computed in the same manner as simple interest.

3. The act of discounting: as, a note is lodged in the bank for *discount*; the banks have sus- pended *discounts*.—4. In *billiards*, an allowance made by a superior to an inferior player of a deduction of one count from his string for every count made by the latter. A *double discount* deducts two counts for one; *three discounts*, three; and so on up to the *grand discount*, which deprives the player who discounts his opponent (gives the odds) of all prior counts whenever the latter makes a successful shot.—*At a discount*, below par; hence, in low esteem; in disfavor.

dismal (diz'māl), *a.* and *n.* [Early mod. E. also *dismall, diemall, dismold, dysmel, dysemel*; < *ME. dismal, dismall, dismale, disemal, dysmall*, found first as a noun in the phrase "in the *dismal*" (see quot. under *IL*, 1), of which the original meaning is not certain, but which prob. stands for "in the *dismal* days or time," the word being most frequent in the phrase *dismal day* or *dismal days* (see quots. under *I*). The origin and meaning of the word have been much debated. It was certainly borrowed, and prob. from the *OF.* From its lack of a recognized literal meaning in E., it must have been borrowed in a figurative sense. "It is just possible that the original sense of *in the dismal* [days or time] was in *tilting time*; with reference to the cruel extortion practiced by feudal lords, who exacted *tenth*s from their vassals even more peremptorily than tithes were demanded for the church." (Skeat.) This view, which is prob. correct, is based upon what appears to be phonetically the only possible origin of *ME. dismal*, namely, < *OF. *dismal, F. *dimal* (vernacular form of *decimal, F. décimal*) = *Sp. diezmal* = *Pg. dizimal, Sp. Pg. also decimal* = *E. acemal*, < *ML. decimalis*, of a tenth, of tithes, < *L. decimus*, tenth, *ML. fem. decima*, a tenth, a tithe, > *OF. disme, F. dime, ME. disme, E. dime*, a tithe, tenth: see *decimal* and *dime*. The notion of official extortion appears further in the related *OF. dismer, diesmer*, decimate, exact tithes, hence despoil (= *Sp. diezmar* = *Pg. dizimar*, pay tithes, decimate: see *decimate*), and in *escheat, cheat*, q. v.] I. *a.* Gloomy; dreary; cheerless; melancholy; doleful; dolorous: originally, as an adjective, in the phrase *dismal day* or *dismal days* (see etymology), whence it was extended to any visible physical surroundings, or anything perceived or apprehended, tending to depress or chill the spirits.

M. C. Tyler, Hist. Amer. Lit., I. 85.

3. In *optics*, the separation of the different colored rays in refraction, arising from their different wave-lengths. The point of dispersion is the

point where refracted rays begin to diverge. When a ray of sunlight is made to pass through prisms of different substances, but of such angles as to produce the same mean deviation of the ray, it is found that the spectra formed are of different lengths. Thus, the spectrum formed by a prism of oil of cassia is found to be two or three times longer than one formed by a glass prism; the oil of cassia is therefore said to *disperse* the rays of light more than the glass, or to have a greater dispersive power. It is also found that in spectra formed by prisms of different substances the colored spaces have to one another ratios differing from the ratios of the lengths of the spectra which they compose; and this property has been called the *irrationality of dispersion* or of the colored spaces in the spectrum. See *prism* and *refraction*.

Dispersion has been accounted for by the different speeds of light of different wave-lengths in the same refracting medium. Tait, Light, § 72.

In consequence of . . . *dispersion* of the colours in various directions of vibration, white light becomes broken up in a mode which is comparable with the *dispersion* of colour by ordinary refraction, and on this account has received the name of circular or rotary *dispersion*. 4. In *med.* and *surg.*, the scattering or removal of inflammation from a part and the restoration of the part to its natural state.—5. In *math.*, the excess of the average value of a function at less than an infinitesimal distance from a point over the value at that point, this excess being divided by $\frac{1}{n}$ of the square of the limiting infinitesimal distance.—*Abnormal dispersion*, in *optics*, a phenomenon exhibited by solutions of some substances, as fuchsin, which give spectra differing from the usual prismatic spectrum in the order of the colors.—*Conc of dispersion*. See *conc*.—*Dispersion of the bisectrices*, in *crystal*, the separation of the bisectrices for different colors observed in many monoclinic and triclinic crystals when the position of the three axes of light-elasticity is not the same for all the rays of the spectrum. It may be *crossed*, *horizontal*, or *inclined*. It is *crossed* when the acute bisectrix coincides with the ortho-diagonal axis. When a section of a biaxial crystal cut normal to the acute bisectrix is viewed in converging polarized light, the dispersion of the optic axes or bisectrices is generally marked by the arrangement of the colors in the interference-figures seen. It is *horizontal* when the obtuse bisectrix coincides with the orthodiagonal axis; and *inclined*, in monoclinic crystals, when the optic axes lie in the plane of symmetry.—*Dispersion of the optic axes*, in *crystal*, the separation of the axes for different colors in biaxial crystals, which takes place when the axial angles have different values; it is usually described as $\rho > \nu$, or $\rho < \nu$, according as the angle for red rays is greater or less than that for blue rays.—*Epiptic dispersion*. See *epiptic*.—*The dispersion*, the Jews dispersed among the Gentiles during and after the Babylonian captivity; the diaspora: most frequently used of the scattered communities of Jews referred to in the New Testament, either of such communities collectively and in general, or of the communities in some single country or group of countries: as, the Parthian *dispersion*; the *dispersion* of Asia Minor; the Egyptian *dispersion*; the *dispersion* in Rome. In the earliest method of spinning, the staff, usually a cleft stick about 3 feet long, on which was wound a quantity of wool, cotton, or flax to be spun. The lower end of the distaff was held between the left arm and the side, and the thread, passing through and gaged by the fingers of the left hand, was drawn out and twisted by those of the right, and wound on a suspended spindle made so as to be revolved like a top, which completed the twist. In Eastern countries and in some districts of Europe, especially in Italy, the primitive distaff and spindle are still used; but after the introduction of the spinning-wheel into Europe, about the fifteenth century, the distaff became an attachment only of that designed for flax, and thus continued in general use till a recent period, modified in form.

Also called *spindle side*.

2. The volatilization and subsequent condensation of a liquid by means of an alembic, a still and refrigeratory, or a retort and receiver; the operation of obtaining the spirit, essence, or essential oil of a substance by the evaporation and condensation of the liquid in which it has been macerated; rectification; in the widest sense, the whole process of extracting the essential principle of a substance. The most common method of conducting the process of distillation consists

in placing the liquid to be distilled in a boiler of copper or other suitable material, called the *still*, having a movable head from which proceeds a cooled tube called the *worm*, which passes through water constantly kept cold. Heat being applied to the still, the liquid in it is volatilized, and rises in vapor into the head of the still, whence, passing down the curved tube or worm, it becomes condensed by the cold water, and makes its exit in a liquid state. The object of distillation is to separate volatile liquids from non-volatile liquids and solid matters, and also, by the operation called *fractional distillation* (which see, below), to separate from each other volatile liquids which have different boiling-points. The process is used in the arts, in the manufacture of alcohol and spirituous liquors, for preparing essences and essential oils, and for a great variety of other purposes.

The mixture is distilled in an apparatus which admits of constant observation of the temperature, and the liquids obtained between certain intervals of temperature (five or ten degrees) are collected separately. The more volatile liquid will be found chiefly in the "fractions" first collected; and by repeating the process with the first fraction, this more volatile liquid may be obtained in a state of comparative or absolute purity.

Thus, in the sentence "All the planets are even," the *all* is *collective*; in the sentence "All the planets revolve round the sun," it is *distributive*.

The *distributive* numerals in Latin are *singuli*, one by one, one each; *binī*, by twos, two each; *ternī*, three each, etc.

$$F \Phi (x, y, z, \text{etc.}) = \Phi (Fx, Fy, Fz, \text{etc.})$$

In a more general sense, every formula which expresses that the operations *f*, *F*, Φ , are so related that in every case $\Phi F(x, y) = f(\Phi x, \Phi y)$.—*Distributive function*, in *math.*, a function such that $f(x + y) = fx + fy$.—*Distributive operation*, in *math.*, an operation subject to a distributive formula.—*Distributive principle*, in *math.*, a rule expressed by a distributive formula.

In reference to political divisions in the United States, it generally imports that the inhabitants act together for some one specific purpose: as, a highway district; a school district; an election district (as a senate, assembly, or congressional district). In some States the term is applied to a class of towns. In South Carolina, during most of the period from 1768 to 1868, the chief subdivision of the State (excepting the coast region) was called a *district*, instead of a county as in the other States. In Tennessee it is called a *civil district*; in Kentucky, a *justice's district*; in Georgia, a *militia district*; in Maryland, an *election district*. In other States these divisions are called *towns* or *townships*. In colonial and provincial Massachusetts the district was a part set off from a town and made independent of it in respect to local administration, but not in respect to choosing a representative to the General Court. In the Methodist Episcopal Church the district is a territorial subdivision of a conference, comprising a number of churches and societies, under the charge of a presiding elder. A *military district* of a country is a division of a military territorial department. The federal territory containing the national capital is called the *District of Columbia*. Abbreviated *Dist.*

C.) and rendered by cyclic choruses. It was perfected, about a century later, by Lasos of Hermione, and at about the same time tragedy was developed from it in Attica. Its simpler and more majestic form, as composed by Lasos, Simonides, Bacchylides, and Pindar, assumed in the latter part of the fifth century a complexity of rhythmical and musical form and of verbal expression which degenerated in the fourth century into a mimetic performance rendered by a single artist. From these different stages in its history the word *dithyramb* has been used in later ages both for a nobly enthusiastic and elevated and for a wild or inflated composition. Hence in mod. speech *divers* is used only with a plural noun. It is now obsolete or archaic, the form *diverse*, regarded as directly from the *L.*, having taken its place. Sw. divination* (in comp.), < *L. divinatio(n-)*, the faculty of foreseeing, divination, < *divinare*, pp. *divinatus*, foresee, *divine*: see *divine*, v.] 1. The act of divining; the pretended art of foretelling by supernatural or magical means that which is future, or of discovering that which is hidden or obscure. The practice of divination is very ancient, and has played an important part in the theologies of almost all nations. The first attempt to raise divination to the dignity of a science is attributed to the Chaldeans. The innumerable forms which have been in use for thousands of years may be reduced to two classes: (1) that effected by a kind of inspiration or divine affluence; and (2) that effected by the observation of certain dispositions and collocations of things, circumstances, and appearances, etc., as the flight of birds, the disposition of the clouds, the condition of the entrails of slaughtered animals, the falling of lots, etc.

Divination hath been anciently and fitly divided into artificial and natural; whereof artificial is when the mind maketh a prediction by argument, concluding upon signs and tokens; natural is when the mind hath a presentation by an internal power, without the inducement of a sign.

The *Divine right of kings*, independent of the wishes of the people, has been one of the most enduring and influential of superstitions, and it has even now not wholly vanished from the world. *Lecky*, Europ. Morals, II. 285.

(b) *Of the clergy*, a claim of divine authority for particular persons and particular forms of ecclesiastical government. < F. *divineresse*; fem. of *diviner*.] A female
diviner or soothsayer; the priestess of an an-
cient oracle. [*Rare*.]

The *divineress* ought to have no perturbations of mind,

nious sound. *Dryden*, *Plutarch*.

diving-beetle (di'ving-bē'tl), *n.* A popular
name for various aquatic beetles of the family
Dytiscidae. They swim freely in the water, and
may often be seen diving rapidly to the bottom,
whence their name. See cut under *Dytiscus*.

diving-bell (di'ving-bel), *n.* A mechanical
contrivance consisting essentially of an inverted
cup-shaped or bell-shaped chamber filled with
air, in which persons are lowered beneath the
surface of the water to perform various opera-
tions, such as examining the foundations of
bridges, blasting rocks, recovering treasure from
sunken vessels, etc. Diving-bells have been made
of various forms, such as that of a bell, or a hollow
truncated cone or pyramid, with the smaller end closed and
the larger one, which is placed
lowestmost, open. The air
contained within the bell pre-
vents it from being filled with
water on submersion, so that
the diver may descend in it
and breathe freely, provided
he is furnished with a new
supply of fresh air as fast as
the contained air becomes vi-
tiated by respiration. The
diving-bell is now generally
made of cast-iron in the form
of an oblong chest (A), open
at the bottom, and with sev-
eral strong convex lenses set
in its upper side or roof, to
admit light to the interior.
It is suspended by chains
from a barge or other suitable
vessel, and can be raised or
lowered at pleasure, in ac-
cordance with signals given by
the persons within, who are
supplied with fresh air in-
jected into a flexible pipe by
means of a forcing-pump (B)
placed in the vessel, while the
vitiating air escapes by a
cock in the upper part of the
bell. An improvement on this
form, called the *nautilus*, en-
ables the occupant, instead of
depending upon the attendants
above, as in the older forms,
to raise or sink the bell, move
it about at pleasure, or raise
great weights with it and de-
posit them in any desired
spot.

Diving-bell.

diving-buck (di'ving-buk), *n.* A book-name

(which see, under *armor*).

diving-spider (di'ving-spi'dér), *n.* An aquatic
spider, *Argyroneta aquatica*, which builds its
nest under water, and habitually dives to reach
it, carrying down bubbles of air, with which it
fills its nest on the principle of the diving-bell.
It is thus enabled to remain under water, though
fitted only for breathing air. See cut under
Argyroneta.

diving-stone (di'ving-stōn), *n.* A name given to
a species of jasper.

divining-rod (di-vi'ning-rod), *n.* A rod or twig
used in divining; especially, a twig, generally
of hazel, held in the hand and supposed by its
bending downward to indicate spots where met-

alliferous deposits or water may be found by
digging. It is usually made of two twigs of hazel, or of
apple or some other fruit-tree, tied together at the top
with thread, or of a naturally forked branch, and is grasped
by both hands in such a way that it moves when at-
tracted by the sought-for deposit. This method of search-
ing for ore or water has been in use for centuries, but its
efficacy is now rarely credited by intelligent persons.

Shall we have most likelihood of success if we dig from
east to west, or from west to east?—or will you assist us
. . . with your *divining-rod* of witches-hazel?

pacity of being divided or separated into parts.
—2. In *arith.*, the capacity of being exactly
divided in—that is, divided without remainder.—
Infinite divisibility, the character of being divisible into
parts which are also divisible, and so on ad infinitum. As
applied to matter, the term implies properly that any por-
tion of matter may, by the exercise of sufficient force, be
separated into parts. After the general acceptance of the
Daltonian theory of atoms, the term *infinite divisibility*
of matter was long retained with the meaning of the infinite
divisibility of space.

The geometricians (you know) teach the *divisibility* of
quantity in *infinitum*, or without stop, to be mathemati-
cally demonstrable. *Boyle*, *Things above Reason*.

I said at first that *infinite divisibility of matter* was the
doctrine now in vogue amongst the learned, but upon
second thoughts I believe I have misrepresented them,
and the mistake arose from want of distinguishing be-
tween *infinite* and *indefinite divisibility*.

viding or separating into parts, portions, or

of a hyphen at the end of a line); the *division*
of labor; the *division* of profits.

I'll make *division* of my present with you;
Hold, there is half my coffer. *Shak.*, *T. N.*, iii. 4.

Specifically—(a) [L. *divisio*(-n), tr. of Gr. *διαίρεσις*.] In
logic, the enumeration and naming of the parts of a whole;
especially, the enumeration of the species of a genus. The
latter is also distinguished as *logical division*. *Division* is
mainly distinguished from *classification* in that the latter
is a modern word, and supposes minute observation of the
facts, while the former, as an Aristotelian term, denotes a
much ruder proceeding, based on ordinary knowledge, and
undertaken at the outset of the study of the genus divided.
One of the distinctive doctrines of the Ramist school of logi-
cians was that all division should proceed by dichotomy.

Division is a dividing of that which is more commune
into those which are lesse commune. As a definition
therefore doeth declare what a thing is, so the *division*
sheweth how many things are contained in the same.
Sir T. Wilson, *Rule of Reason* (1551).

Division is the parting or dividing of a word or thing
that is more general, unto other words or things lesse ge-
neral. *Blundeville*, *Arte of Logicke* (1509), ii. 3.

(b) In *her.*, the separating of the field by lines in the di-
rection of the bend, the bar, etc. (called *division bendwise*,

barrier, etc.), also for the purpose of impaling two shields together, or in quartering. (c) The separation of members in a legislative house in order to ascertain the vote. This is effected in the British House of Commons by the passing of the affirmative and negative sides into separate lobbies, to be counted by tellers; in American legislatures, by their rising alternately, or, as is frequently done in the House of Representatives, by passing between tellers standing in front of the Speaker's desk. In the British House of Commons the usual method of voting on any contested measure is by division; in the United States, by yeas and noes, or affirmative and negative answers on a call of the roll.

The motion passed without a *division*. *Macaulay*.

2. In *math.*: (a) The operation inverse to multiplication; the finding of a quantity, the quotient, which, multiplied by a given quantity, the divisor, gives another given quantity, the dividend. In elementary arithmetic division is often defined as, for example, "the partition of a greater summe by a lesser" (*Reorde*, 1540); but such a definition applies only when the quotient is an abstract number and an integer. Division is denoted by various signs. Thus, *a* divided by *b* may be written in any of the following ways:

$$a \div b, \frac{a}{b}, a/b, a:b, ab^{-1}.$$

Where multiplication is not commutative (that is, where *xy* is not generally equal to *yx*) there are two kinds of division: for if *xy = z*, *x* may be regarded as the quotient of *z* divided by *y*, or *y* as the quotient of *z* divided by *x*. These two kinds of division are denoted as follows:

$$xy \div y = x, \frac{xy}{y} = x, xy/y = x, xy:y = x, x^{-1}(xy) = y.$$

Division is one of the fundamental operations in arithmetic, common algebra, and quaternions; but in other forms of algebra it generally gives an indeterminate quotient, and so loses its importance. (b) A rule or method for ascertaining the quotient of a divisor into a dividend: as, long *division*. (c) A section; the separation of a geometrical figure into two parts.—3. The state of being divided; separation of parts: as, an army weakened by *division*; *divisions* among Christians.

Hate is of all things the mightiest divider; nay, is *division* itself. *Milton*, *Divorce*, ll. 21.

4. That which divides or separates; a dividing line, partition, or mark of separation; any sign or cause of separation or distinction.

I will put a *division* between my people and thy people. *Ex. viii.* 23.

5. A part separated or distinguished in any way from the rest; a minor part or aggregate; a distinct portion: as, the *divisions* of an orange; a *division* of mankind or of a country; the *divisions* of a book or of a discourse.

Express the heads of your *divisions* in as few and clear words as you can. *Swift*.

Specifically—(a) A definite part of an army or of a fleet, consisting of a certain number of brigades or of vessels under a single commander.

For his *divisions*, as the times do brawl,
Are in three heads; one power against the French,
And one against Glendower; perforce, a third
Must take up us. *Shak.*, 2 Hen. IV., l. 3.

(b) A part of a ship's company set apart for a certain service in action. Those who serve at the guns are classed as the *first*, *second*, *third*, and *fourth divisions*; the *powder division* provide the guns with ammunition; the *master's division* steer the ship and work the sails; and the *engineer's division* manage the engines and the boilers. (c) A geographical military command, consisting of two or more departments. Thus, the Military *Division* of the Missouri consisted of the department of Dakota, the department of the Platte, the department of the Missouri, and the department of Texas. The United States is divided for military purposes at the present time (1899) into eight departments (see *department*), the system of divisions having been discontinued. (d) In *nat. hist.*: (1) In zoological classification, any group of species forming a part of a larger group: in entomology, sometimes specifically applied to a group smaller than a suborder and larger than a family, as the division *Gynnocerata* of the *Heteroptera*. A *section* may be equivalent in value to a division, or a group subordinate to it; a *series* is a division in which the minor groups show a regular gradation in structure. (2) In botanical classification, one of the higher grades in the sequence of groups, equivalent to *subkingdom* or *series*, as the phenogamous and cryptogamous *divisions* of plants. It is also often used as subordinate to *class*, as the polypetalous, apetalous, etc., *divisions* of dicotyledonous plants. By some authors it has been used to designate a grade between *tribe* and *order*.

6. The state of being divided in sentiment or interest; disunion; discord; variance; difference.

There was a *division* among the people. *John vii.* 43.

Between these two
Division smoulders hidden.
Tennyson, *Princess*, ll.

Earth, these solid stars, this weight of body and limb,
Are they not sign and symbol of thy *division* from Him?
Tennyson, *The Higher Pantheism*.

7. In *music*, a rapid and florid melodic passage or phrase, usually intended to be sung at one breath to a single syllable: so called because originally conceived as the elaboration of a phrase of long tones by the division of each

into several short ones. It was common in the music of the eighteenth century.

Sweet as ditties highly penn'd,
Sung by a fair queen in a summer's bower,
With ravishing *division*, to her lute.

Shak., 1 Hen. IV., ll. 1.

Music, advance thee on thy golden wing,
And dance division from sweet string to string.
Middleton, *Blurt*, *Master-Constable*, l. 1.

Now that the manager has monopolized the Opera-house, haven't we the signors and signoras calling here, sliding their smooth semibreves, and gargling glib *divisions* in their outlandish throats?
Sheridan, *The Critic*, i. 1.

8. The precise statement of the points at issue in any dispute. [Rare.]

The *division* is an opening of thynges wherein we agree and rest upon, and wherein we stick and stand in trayers, shewing what we have to saie in our owne behalfe.

Sir T. Wilson, *Rhetoric* (1553).

9. See the extracts.

At the University of Cambridge, England, each of the three terms is divided into two parts. *Division* is the time when this partition is made.

B. H. Hall, *College Words*.

The terms are still further divided, each into two parts; and, after *division* in the Michaelmas and Lent terms, a student who can assign a good plea for absence to the College authorities may go down and take holiday for the rest of the time. *C. A. Bristol*, *English University*, p. 87.

Accidental division, a division of a subject according to its accidents: as, good things are, according to Aristotle, either qualities of mind, qualities of body, or accidents of fortune.—**Centesimal division**. See *centesimal*.

—**Complementary division**, a method of division given by Boëthius. The smallest round number larger than the divisor is used, and also the complement of the divisor, or the remainder after subtracting it from the round number. The first figure of the quotient is set down, from the dividend is subtracted, the product of this by the round number, and to the remainder is added the product of the same figure of the quotient by the complement of the divisor. The sum is treated as a new dividend.—**Complex or compound division**, the division of a complex or compound number either by a number of the same sort or by an abstract number, as the division of 3 days 13 hours 17 minutes by 1 day 18 hours 28 minutes 88 seconds, or by 7.—**Direct division**. (a) Division not complementary. (b) A rule for dividing one number by another, so as to obtain the entire period of the circulating decimal of the quotient.

Both dividend and divisor are multiplied by the same number so as to make the last significant figure of the divisor 9. By striking off from the divisor so multiplied the 9, together with any ciphers which may follow it, and increasing the truncated remnant by 1, a number is obtained called the current multiplier. The last figure of the multiplied dividend is now struck off, multiplied by the current multiplier, and the product added to the truncated dividend. The sum is treated as a new dividend; and this process is continued until the dividends begin to repeat themselves. The successive figures struck off from the dividend from last to first are now written down from left to right as a whole number, and subtracted from the circulating part of the same figure repeated indefinitely into the decimal places. The remainder, after shifting the decimal point as many places to the left as there were zeros struck off from the divisor along with the 9, is the quotient sought.—**Division by circulating decimals**, a method of dividing by means of a table of circulating decimals.—**Division by factors**, the process of dividing successively by factors of the divisor.—**Division by logarithms**, a method of dividing based on the fact that the logarithm of the quotient is the logarithm of the dividend diminished by the logarithm of the divisor.—**Division of a ratio**, the reduction of a proportion from *a:b = c:d* to *b-a:a = d-c*.—**Division of labor**, in *polit. econ.*, the dividing up of a process or an employment into particular parts, so that each person employed can devote himself wholly to one section of the process.—**Division of the question**, in a legislative body, the division of a complex proposition or motion into distinct propositions, in order that each may be considered and voted upon separately: a course resorted to, upon motion or demand, when any of the members favor parts but not the whole of the measure. The presiding officer usually has the power of deciding whether such division is admissible.—**Division viol**. See *viol*.—**General of division**. See *general*, n.—**Golden division**, arithmetical division not complementary.—**Harmonic division of a line**. See *harmonic*.—**Iron division**. Same as *complementary division*.—**Logical division**, any division not a partition, being either a nominal, substantial, or accidental division.—**Long division**, the common modern method of arithmetical division when the divisor is a number larger than 10. The greatest number of times that the divisor is contained in the first figures of the dividend, beginning with the left (a sufficient number being taken to make a number greater than the divisor), is set down to the right of the dividend, as the first figure of the quotient; the divisor is then multiplied by this quotient, and the product is subtracted from the left-hand part of the dividend; to the remainder the next figure to the right in the dividend is then annexed, and the number thus formed is treated as a new dividend; and so on. The same method is extended in algebra to the division of polynomials in general. The rule is of Italian origin. See *scratch division*.

—**Nominal division**, an enumeration of the different senses of an equivocal word or expression; a distinction.—**Partible division**, the mental division of a whole into its parts, as of the English nation into sovereign, lords, and commons; partition.—**Real division**, a division relating to facts, not a mere distinction between different meanings of a word, embracing substantial, partible, and accidental division; the explication of a whole by its parts.—**Scratch division**, the ordinary method of division before long division came into general use, late in the seventeenth century. The products were not set down at all, but only the remainders. The divisor was set down under the dividend; the first figure of the quotient was then set

down and was multiplied by the first figure of the divisor, and the remainder was set down over the corresponding figures of the dividend, which were immediately canceled, together with the first figure of the divisor. This process having been repeated until the whole divisor had been canceled, the latter was written down again one place further to the left, the second figure of the quotient was set down, and the whole proceeding repeated until a remainder was obtained less than the divisor. The following shows the successive stages of the division of 351 by 13:

		1	19	19	19	2	2
351	351	(2	351	(2	351	(27	351
13	13	13	133	133	133	133	133
			1	1	1	1	1

The rule was derived from Arabian writers.—**Short division**, a process of division practised with a divisor not being larger than 10, in which the quotient is set down directly, being written from left to right, usually below a line under the dividend, without auxiliary figures.—**Substantial division**, or **division per se**, the division of a genus into its species.—**To run division**, in *music*, to make florid variations on a theme.

It is often used, however, to signify a judicial separation, or termination of cohabitation, more specifically called a *limited divorce*, or a *divorce a mensa et thoro* (from bed and board); and it is sometimes also used more broadly still of a judicial decree that a supposed marriage never had a valid existence, as in case of fraud or incapacity.

III. *auxiliary and substitute.* 1. As an auxil-
iary, *do* is inflected, while the principal verb is
in the infinitive without *to*, and originally and
strictly the object of *do*: thus, I do know is I
perform an act of knowing. Compare *shall* and
will.

O blessed Bond! O happy Marriage!
Which doest the match twixt Christ and vs presage!
Sylvester, tr. of Du Bartas's Weeks, l. 6.

Certain uses of *do* as an auxiliary, with both transitive

ing interrogative and negative expressions: as, do you
want this book? I do not long for it; does he do his work
well? he does not do it as well as I expected.

thou); do you stay here (instead of stay, or stay you here).
(c) To express emphasis: as, I do wish you had seen him; I
did see him; do be quick; do not (don't) do that. (d) Some-
times (now chiefly in poetry, where it is often used for
merely metrical reasons, but formerly often in prose)
merely as an inflection of the principal verb, with no other
effect.

2. *Do*, being capable of denoting any kind of
action required by the circumstances in con-
nection with which it is used, is often employed
as a substitute for the principal verb, or for the
whole clause directly dependent upon it, to
avoid repetition: as, conduct your business on
sound principles; so long as you do, you are safe.
In such an expression there is an ellipsis either of the prin-
cipal verb or of *this, that, these things, so, etc.*: as, I in-
tend to come, but if I do not you will know how to act;
so long as you do (so), you are safe.

*do*⁴ (dō), *n.* [A mere syllable, more sonorous
than *ut*, for which it is substituted.] In *solmi-*
zation, the syllable now commonly used for the
first tone or key-note of the musical scale, and
also for the tone C (as the key-note of the typi-
cal scale of the pianoforte keyboard). About
1670 it replaced the Arretinian *ut*, which is still somewhat
used in France. In the tonic sol-fa system it is spelled
doh, and indicated by its initial *d*; its significance is lim-
ited to the first tone of the scale, without reference to the
keyboard. In teaching sight-singing by the help of *sol-*
mization, two general methods are in use: (a) the *fixed-do*
method, in which *do* is always applied to tones bearing
the letter-name C, whether they are key-notes or not; and
(b) the *movable-do* method, in which *do* is always applied
to the key-note, whatever be its letter-name. The second
method is generally regarded as the more scientific, and
is far the more practical, although the first has had the
support of many excellent musicians.

dock³ (dok), n. [< MD. docke = D. dok = Flem. dok, a dock; cf. (from the E. or D.) Sw. docka = Dan. dok, dokke = G. dock, docke = F. dock, a dock. Origin unknown; cf. OFlem. docke, a cage (see dock⁴); Icel. dōkk, dōkdh, a pit, pool, = Norw. dokk, dōkk, dekt, a hollow, low ground surrounded by hills. The word is by some connected with It. doccia, a canal, conduit, pipe, formerly also "a damme of a mill" (Florio), ult. < L. duerc, lead (see douche, duct), or with ML. doga, a ditch, canal, also a vessel, cup, perhaps < Gr. δοχή, a receptacle, < δέχεσθαι, receive.] In hydraulic engin., strictly, an inclosed water-space in which a ship floats while being loaded or unloaded, as the space between two wharves or piers; by extension, any space or structure in or upon which a ship may be berthed or held for loading, unloading, repairing, or safe-keeping. The water-space may communicate freely with the stream or harbor, or the entrance to it may be closed by a gate or by a lock. If provided with a lock or gate, the level of the water within the dock remains at all times nearly the same, as the gate is opened only at full tide, when the level without and within is the same. If a lock is employed, vessels can pass in and out at all stages of the tide, but this does not materially affect the level of the water inside the dock. In an open dock the tide continually lowers or raises the vessel, and this interferes in some degree with the work of loading or unloading. The closed docks are free from this

inconvenience, while a greater advantage is found in the absence of currents. In a larger sense the term is also applied to a basin or inclosed water-space for the storage of floating timber or the safe-keeping of river-steamers, barges, or canal-boats laid up for the winter, and by a further extension is made to include the wharves and warehouses on or in the neighborhood of a dock. The largest closed docks are at Liverpool and London, in England. In a particular sense the term is also applied to the construction and apparatus used in repairing and building ships, as the floating dock, dry-dock, depositing-dock, and sectional dock.

The saide shippe, called the Holy Crosse, was so shaken in this voyage, and so weakened, that she was layd vp in the docke, and neuer made a voyage after.

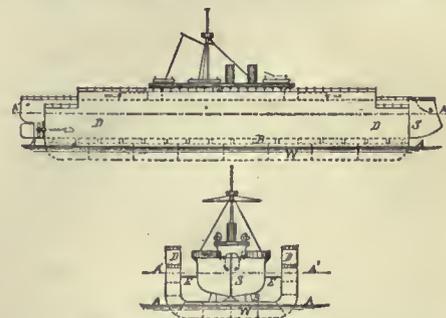

Hakluyt's Voyages, II. i. 98.

Depositing-dock, a caisson or an elevator for lifting vessels from the water and placing them upon stagings or wharves erected for the purpose. The lifting apparatus consists of a series of caissons or pontoons, placed side by side and joined at one end to another pontoon that, with a series of upright tubular structures, forms a girder, and makes the back of a comb-like structure, of which the pontoons are the teeth. In the rear of the girder is a large floating pontoon, connected with it by two rows of heavy booms that, being pivoted at each end, serve as a series of parallel bars and keep the entire structure upright while afloat. To lift a vessel, a row of blocks with shores and chocks is arranged on top of all the pontoons. The air is allowed to escape, and the entire structure, except the float in the rear, sinks till the vessel can be floated over the pontoons. When the vessel is in position the water is pumped out of the pontoons, and they all rise together, lifting the vessel out of the water.—Dry-dock, a dock or an excavated basin adjoining navigable water, provided with a gate, and so arranged that, after the docking of a ship, the water can be exhausted from it. Such docks are long and narrow, with sloping sides formed in steps. The modern method of construction is to excavate the basin in the shore, and to drive heavy piling along the bottom and upon the sloping sides and rear end. Upon the piles are laid heavy timbers to form the floor and the steps at the sides. At the entrance are double gates opening outward, and meeting at an angle when closed, to resist the pressure of the water on the outside when the dock is empty. A recent method of closing a dry-dock is by means of a float-

Dry-dock, or Graving-dock.

ing gate or caisson with flat bottom and wide stem and stern, which is floated into position across the entrance and loaded with water-ballast till it sinks, fitting tightly by a keel into a groove in the gateway. To use the dock, the gate is opened, or floated away at high water, and the ship is drawn into the dock and held afloat over a line of blocks along the center of the dock. The gate is then put in position, and sunk till the dock is closed water-tight. The water within the dock is then exhausted by steam-pumps, leaving the ship supported on the blocks, and braced on both sides by shores extending to the dock-steps. A typical dry-dock is the Brooklyn Navy-yard Dock No. 1, which is 500 feet long, 60 feet wide at the bottom, and capable of admitting a ship drawing 18 feet. Steam-pumps with a capacity of 40,000 gallons of water a minute are used to empty it.—Floating dock, a capacious wooden or iron structure, generally rectangular, intended to serve as a graving-dock. Sometimes floating docks are built in water-tight compartments, and can be sunk to the required

depth by the admission of water into these compartments. When the vessel is docked, the floating dock is raised by pumping, till its bottom touches the keel of the ship. Shores are then added to keep the ship in position, and the dock is raised higher. Instead of compartments, water-tight tanks are occasionally used, and the dock is raised and

lowered on the same principle. A floating dock may also be made so heavy as to sink by its own weight deep enough to receive the largest vessel, and be raised by means of empty water-tight tanks, which lift dock and ship by their buoyancy.—**Graving-dock**, a dry-dock: so called because used in graving or cleaning the bottom of ships. The graving-docks in the navy-yards of Brooklyn, Boston, and Norfolk are important examples.—**Half-tide dock**, a basin connecting two or more docks, and communicating with the entrance-basin.—**Sectional dock**, a floating dock composed of a succession of pontoons or caissons attached to a platform below the vessel. Steam-pumps are used to remove the water from the caissons, and, as they float, the vessel is raised.

See occasional.—Monroe doctrine, in American politics, the doctrine of the non-intervention of European powers in matters relating to the American continent. It received its name from statements contained in President Monroe's annual message to Congress in December, 1823, at the period of a suspected concert of the powers in the Holy Alliance to interfere in Spanish America in behalf of Spain. The following are the most

significant passages in the message: "We could not view an interposition for oppressing them [the Spanish-American republics] or controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition toward the United States." "The American continents should no longer be subjects for any new European colonial settlement."

The only thing which the Monroe Doctrine really contains is the intimation on the part of the United States of a right to resist attempts of European Powers to alter the constitutions of American communities.

G. P. Fisher, Outlines of Universal Hist., p. 602.

=*Syn. 1. Precept, Doctrine, Dogma, Tenet. Precept* is a rule of conduct, generally of some exactness, laid down by some competent or authoritative person, and to be obeyed; it differs from the others in not being especially a matter of belief. (See *principle*.) *Doctrine* is the only other of these words referring to conduct, and in that meaning it is biblical and obsolescent. In the Bible it refers equally to teaching as to the abstract truths and as to the duties of religion: "In vain they do worship me, teaching for doctrines the commandments of men." (Mat. xv. 9.) As distinguished from *dogma* and *tenet*, *doctrine* is a thing taught by an individual, a school, a sect, etc., while a *dogma* is a specific doctrine formulated as the position of some school, sect, etc., and pressed for acceptance as important or essential. *Dogma* is falling into disrepute as the word for an opinion which one is expected to accept on pure authority and without investigation. *Tenet* is a belief viewed as held, a doctrinal position taken and defended. It is equally applicable to the beliefs of an individual and of a number; it has no unfavorable sense.

faces of an ordinary icosahedron. It has 12 faces, 12 vertices, 30 edges, 5 sides per face, and 5 sides per vertex. tus, the type of the family *Dididae* and suborder *Didi*, now usually assigned to the order *Columbae*. The dodo was living in Mauritius on the discovery of that island by the Portuguese under Mascarenhas in the beginning of the sixteenth century, and it is known to have survived until July, 1681. Knowledge of the bird was for some time confined to the quaint and often questionable narratives of voyagers, certain pictures, mostly by Dutch artists, and a few fragmentary remains. In 1866 bones in abundance were found, and the osseous structure has been described in detail. The dodo was a massive, clumsy, flightless, and defenseless bird, about as large as a swan, covered with downy feathers, with a very stout hooked bill, short strong legs, short tail, and wings too small for flight; so that it soon succumbed under the new conditions which the occupation of the island introduced, its extinction being probably due as much to the animals which man introduced as to the human invaders of the island. The solitaire (*Pezophaps solitaria*) of Rodriguez, an island of the same group, was similar to the dodo, but sufficiently distinct to be placed in a different genus. (See *solitaire*.) The neighboring island of Réunion or Bourbon also had a dodo, in all probability a third kind.

You shall recue . . . a strange fowle: which I had at the Iland Mauritius called by ye Poringalls a *Do Do*: which for the rareness thereof I hope will be welcome to you.

Emanuel Altham, letter written in 1628.

(from LG. or E.) OF. and F. *dogue* = Sp. *dogo* = Pg. *dogo*, *dogue* = It. *dogo*, a mastiff, bulldog; origin unknown. The general Teut. and Indo-European name for the dog appears in *hound*, *q. v.* Hence in comp. *bandog*, *bulldog*, etc.] 1. A quadruped of the genus *Canis*, *C. familiaris*. The origin of the dog is a question most difficult of solution. Some think the breed is derived from the wolf, others affirm it to be from a familiarized jackal; all agree that no trace of it is to be found in a primitive state, the dhole of India and the dingoo of Australia being wild descendants from domesticated ancestors. The view now generally taken by naturalists is that the dog is neither a species, in the zoological sense, nor even the descendant of any one species modified by domestication, but that the dogs of different parts of the world have a correspondingly various ancestry, from different wild species of the genus *Canis*, as wolves, foxes, and jackals. This view is supported not only by the enormous differences between dogs, but also by the readiness with which nearly all dogs cross with their wild relatives; and, accordingly, the name *Canis familiaris* is a conventional rather than a proper zoological designation of the dog as a species. No satisfactory classification of the different kinds of dogs has been arrived at, what some naturalists regard as types being regarded by others as mere mongrels. An old classification grouped dogs in three classes, the *Celeres*, *Sagaces*, and *Pugnaces*. Colonel Hamilton Smith groups the domestic dog into six sections: (1) the *wolf-dogs*, including the Siberian, Eskimo, Newfoundland, Great St. Bernard, sheep-dog, etc.; (2) *watch- and cattle-dogs*, including the German boar-hound, Danish dog, dog of

the North American Indians, etc.; (3) the *greyhounds*, as the different kinds of greyhound, Irish hound, lurcher, Egyptian street-dog, etc.; (4) the *hounds*, as the bloodhound, staghound, foxhound, harrier, beagle, pointer, setter, spaniel, springer, cocker, Blenheim dog, poodle, etc.; (5) the *cats*, including the terrier and its allies; (6) the *mastiffs*, including the different kinds of mastiff, bulldog, pug-dog, etc. All these are artificial varieties, having comparatively little stability, their distinctive characters being soon lost by reversion to a more generalized type if they are left to interbreed. This tendency to reversion requires to be constantly counteracted by "artificial selection" at the hands of breeders, in order that the several strains may be kept pure, and their peculiarities be perpetuated along the desired lines of specialization. The best-bred dogs, of whatever kind, are those furthest removed from an original or common type of structure. The differences between dogs of all kinds are vastly greater than those found among individuals of any species in a state of nature; so great that, were they not known to be artificial, the dog would represent several different genera of the family *Canidae* in ordinary zoological classification. In fact, some genera, based upon actual and constant differences in the dental formula, have been named in order to signalize certain structural modifications which are found to exist, affording an example of the evolution of generic characters as well as of specific differences. These variations extend not only to size and general configuration, character of the pelage, and other outward features, but also to positive osteological and dental peculiarities, more marked probably than those of any other domesticated animals. The corresponding physiological and psychological differences are equally decided, as witnessed in the dispositions and temperaments of dogs, their comparative docility, intelligence, etc., and consequently the uses to which they are or may be put. In the matter of size alone, for example, some toy dogs are tiny enough to stand easily on one of the fore paws of a large dog. Throughout the endless varieties, however, the influence of heredity is witnessed in the readiness with which dogs interbreed with one another, and cross with wolves, foxes, and jackals, bearing fertile progeny in all cases, and the readiness with which they revert to the wild state of their several ancestors. See the names of the several breeds. See also *Canidae* and *Canis*.

Now is a *dogge* also dere that in a dych lygges.
Alliterative Poems (ed. Morris), ii. 1702.
Many pretty ridiculous aspersions are cast upon *dogges*, so that it would make a *dogge* laugh to hear and understand them: as, I have heard a man say, I am as hot as a *dogge*, or, as cold as a *dogge*; I am like a *dogge* (when indeed a *dogge* never sweats); as drunk as a *dogge*; hee swore like a *dogge*; and one told a man once that his wife was not to be beleev'd, for shee would lye like a *dogge*.

Chaucer, Merchant's Tale, l. 770.

Eskimo dog, one of a breed of dogs extensively spread over the northern regions of America and of eastern Asia. It is rather heavier than the English pointer, but appears smaller on account of the shortness of its legs. It has oblique eyes, an elongated muzzle, and a bushy tail, which characteristics give it a wolfish appearance. The color is generally a deep dun, obscurely barred and patched with a darker color. It is the only beast of burden in arctic latitudes, and with a team of such dogs attached to his sledge the Eskimo can travel 60 miles a day for several successive days.—**Field-dog**, a dog used for the pursuit of game in the field. In the United States the term is commonly applied to pointers and setters.—**Hunting-dog**. (a) A dog used for hunting. (b) The painted hyens or cynhyene. See *Lycuon*.—**Maltese dog**, a very small kind of spaniel with long silky hair, generally white, and with a round muzzle.—**Newfoundland dog**, a fine variety of the dog, supposed to be derived from Newfoundland, where it is employed in drawing sledges and little carriages laden with wood, fish, or other commodities. There are several varieties of this dog, the principal being a very large breed with broad muzzle, head carried well up, noble expression, waving or curly hair, thick and bushy curled tail, black and white color. Another breed is smaller and almost entirely black. Some breeds seem to be crossed with lions, mastiffs, etc. The Newfoundland dog is remarkable for its sagacity, patience, and good nature, and for its affection for its master. No dog excels it as a water-dog; its broad half-webbed paws making it an excellent and powerful swimmer.—**Pouched dog**, a marsupial, the thylacine dasyure of Tasmania. See *hyena*, 2, and *zebra-wolf*.—**Prairie dog**. See *prairie-dog*.—**To rain cats and dogs**. See *cat*.—**To the dogs**, to waste, ruin, perdition, etc.: used with *give*, *go*, *send*, *throw*, etc.

S.; and this date has been widely accepted. But he also says the sun was then entering Leo, which rule, making the dog-days begin July 23d, has also been used. Hippocrates (450 B. C.) says they were in the hottest and most unhealthy part of summer. If the season was of Babylonian origin, it would originally probably have been in early summer. The power and dignity of the doges were originally very great, but gradually became limited through the jealousy of the Venetian aristocracy. In Genoa the dignity was established in the fourteenth century; the doge was at first elected for life, but from the first part of the sixteenth century the term was restricted to two years, and the authority of the doge became more limited. The office disappeared in Venice in 1797, at the overthrow of the republic, and in Genoa in the same year, although there was a temporary restoration of it in the latter city a few years later.

dogger² (dog'ér), *n.* [Sc. also *doggar*: see below. The term was introduced into English geology by Young and Bird in 1822.] A sandy and oolitic ironstone. The term *Dogger Series*, however, is generally taken to include not only the dogger proper, but the gray and yellow sands which underlie it. The Dogger Series rests upon the alum shale (Upper Lias) in Yorkshire, where *dogger* is a provincial word meaning a rounded stone, in allusion to the rounded appearance caused by atmospheric action on the large blocks into which the rock is divided by joints. The dogger is much worked for the iron ore which it contains. This name as used by Continental geologists is the equivalent of that part of the Jurassic series which corresponds to the Lower Oolite of the English geologists. It is the Brown Jura of the Germans, and is there divided into three groups, distinguished by their fossil remains. The entire series consists of many alternations of clays, marls, shales, and sandstones, frequently containing iron ore, as is the case in England.

2. The monetary unit or standard of value of the United States and Canada, containing 100 cents, and equal to about 4s. 1¼d. English. In the United States it is represented in the currency by gold and silver coins and by notes; in Canada by notes only. A two-dollar gold coin is current in Newfoundland. This unit was established in the United States under the confederation of the States, by resolution of Congress, July 6th, 1787. It was represented by a silver piece, the coinage of which was authorized by the act of Congress, August 8th, 1786, by which was also established the decimal system of coinage. The coinage was not begun until two years after the law of April 2d, 1792, establishing the mint. That law provided for the coinage of "dollars or units, each to be of the value of a Spanish milled dollar," as that coin was then current, and to contain 37½ grains of pure silver, or 416 grains of standard silver. The Spanish dollar above mentioned was that struck in Spanish America.

Dollar of the United States, 1795.
(Size of the original.)

The Spanish dollar above mentioned was that struck in Spanish America. Spanish-American dollars, and coins representing halves, quarters, eighths, and sixteenths of them (the last two known as *shillings* and *sixpences* in New York and some other States, and by other names elsewhere), were abundant in the United States during the latter part of the eighteenth and the first half of the nineteenth century. The Spanish dollar coined in Spain was rare, but the intrinsic value of the two coins was the same. By an act of January 18th,

1837, the dollar was made to consist of 412½ grains $\frac{3}{16}$ fine, the quantity of pure silver remaining the same, 3714 grains. This dollar, being worth in market value from 100 to 104 cents, went out of circulation. An act of March 3d, 1849, directed the coinage of gold dollars of 25.8 grains $\frac{3}{16}$ fine, 23.22 being pure gold; and by act of February 12th, 1873, this was declared the unit of value of the United States. The coinage of gold dollars was suspended by the act of September 26th, 1890. An act of February 25th, 1873, directed the Secretary of the Treasury to purchase silver bullion, not less than \$2,000,000 nor more than \$4,000,000 per month, and cause it to be coined into standard silver dollars. This was repealed by the (Sherman) act of July 14th, 1890, which provided for the purchase of 4,500,000 ounces of silver each month and the coinage of 2,000,000 ounces a month. This act was repealed in 1893. The coins representing fractional parts of the dollar are: in silver, the half-dollar and quarter-dollar, or 50-cent and 25-cent pieces, and the dime or 10-cent piece; in nickel, the half-dime or 5-cent piece (originally in silver, and inconveniently small); and in bronze, the cent (originally in copper, and much larger) and the 2-cent piece. There is also a 3-cent piece, originally coined in silver and afterward in nickel, which has been little used owing to its inconvenient smallness in both forms. By the term *dollar* in the United States notes is intended the coined dollar of the United States, a certain quantity in weight and fineness of gold or silver, authenticated as such by the stamp of the government. Sometimes abbreviated *dol.*, but commonly represented by the symbol \$ (the dollar-mark) before the number. See *coinage ratio*, under *coinage*.

The Almighty Dollar, that great object of universal devotion throughout our land, seems to have no genuine devotees in these peculiar villages.

W. *tolfaen*, an omen-stone (*faen* in comp. for *maen*, a stone).] A structure consisting of one large unhewn stone resting on two or more unhewn stones placed erect in the earth; a term also frequently used as synonymous with *cromlech*.

The name is sometimes given also to structures where several blocks are raised upon pillars so as to form a sort of gallery. The most remarkable monument of this kind is probably that known as the Pierre Couverte, near Saumur, in France. It is 64 feet long, 14 feet wide,

and about 6 feet high, and consists of four upright stones on each side, one at each end, and four on the top. The great stone of the dolmen represented in the accompanying cut is 33 feet long, 14½ feet deep, and 18½ feet across; it is calculated to weigh 750 tons, and is poised on the points of two natural rocks. It is now generally believed that dolmens were sepulchers, although afterward they may have been used as altars. They are often present within stone circles. The dolmen was probably a copy of a primitive rude dwelling, and may sometimes have been the actual structure in which the savage sheltered himself, converted afterward into his tomb. In several cases one of the stones is pierced with a hole. This is supposed to have been for the purpose of introducing food to the dead. Conclusions in regard to the original identity of various races have been based on the similarity of such structures in various parts of the world, as in Hindustan, Circassia, Algeria, and Europe; but too much importance may be attached to this, as the inclosed dolmen is simply the structure which savages of a very low type, of whatever race, would naturally erect for shelter. See *cromlech* and *menhir*.

2. In law, the place where a person has his home, or his principal home, or where he has his family residence and personal place of business; that residence from which there is no present intention to remove, or to which there is a general intention to return. The domicile depends not on citizenship, nor on presence, but on the concurrence of two elements: 1st, residence in a place; and 2d, the intention of the person to make that place his home. Thus, a man may be a citizen of one country, have his domicile in another, and temporarily reside in a third. Domicile is of three kinds: 1st, *domicile of origin or nativity*, depending on that of the parents at the time of birth; 2d, *domicile of choice*, which is voluntarily acquired by the party; and 3d, *domicile by operation of law*, as that of a wife arising from marriage. The term *domicile* is sometimes used to signify the length of residence required by the law of some countries for the purpose of establishing jurisdiction in civil actions; in Scotland, residence for at least forty days within the country constitutes a domicile as to jurisdiction. All questions relating to personal property, in matters of debt, intestacy, or testamentary disposition, are determined by the law of the place of domicile, while those relating to real property are subject to the law of the place where it is situated. The property of a foreigner domiciled in a country with which his own is at war is held to be subject to seizure as that of an alien enemy.

It would be more correct to say that that place is properly the *domicil* of a person in which his habitation is fixed without any present intention of removing therefrom. *Story, Conflict of Laws, iii. § 43.*

"Two things must concur," says the same eminent jurist (Story), "to constitute *domicile*—first, residence, and secondly, intention of making it the home of the party," and when once *domicile* is acquired it is not shaken off by occasional absences for the sake of business or of pleasure, or even by visits to a former *domicile* or to one's native country. *Woolsey, Introd. to Inter. Domini-cal or Sunday letter, one of the seven letters A, B, C, D, E, F, G, used in calendars to mark the Sundays throughout the year. The first seven days of the year being marked by the above letters in their order, the following seven and all consecutive sets of seven days to the end of the year are similarly marked, except that in leap-years the 24th and 25th of February receive the same letter; as that on whatever day the first Sunday of the year falls, the letter which marks it will mark all the other Sundays of the year, except in leap-year, when after February 24th the dominical letter for the remainder of the year changes to the one preceding. (Many modern writers make the change of letter to occur after the end of February, the 29th taking no letter.) After twenty-eight years the same letters return in their order. The use of the dominical letter is primarily to aid in determining the date of Easter; but it may be used, by calculation, for finding the day of the week on which a given date falls in any year, past or future. To find the dominical letter of any year, let *p, q, r, s*, respectively, be the digits in the thousands', hundreds', tens', and units' places of the number of the year. Then, if the year is new style, find the sum $6p + 2q + 5r + 4s + 1$, and diminish it by the quotient of the year divided by 400 (neglecting the remainder). If it is old style, form the sum $3p + 1 + q + 5r + 4s$. In either case increase the result by double the remainder after dividing the year by 4 (this remainder being taken as 4 for January and February of a leap-year). Divide the result by 7, and the remainder is the ordinal number of the dominical letter in the alphabet (the ordinal number of G being called 0).

II. n. One of an order of mendicant friars instituted by the Spaniard Domingo de Guzman in Languedoc in France, and confirmed by the pope in 1216. The official name of the order is Frateres Prædicatores (rendered in English Friars Preachers, Preaching Brethren or Friars, Predicants, or Order of Preachers), preaching and instruction being the chief objects of its foundation. It was established by Dominic himself also in Italy and Spain, and spread rapidly in other countries. In England its members were called Black Friars, from their black cloaks, and in France Jacobins, from the church and hospital of St. Jacques (Jacobus), in which they were first established in Paris. Their rules, based upon those of St. Augustine, enjoin poverty, chastity, fasting, and silence; but the last two may be dispensed with when they would interfere with active duties. The officers of the order are all elective. The highest, holding his place six years, is termed general; provincial and conventual priors have charge respectively of provinces and convents. The Dominicans and Franciscans, originating about the same time and long vehement rivals, were the leading orders of the Roman Church until the rise of the Jesuits in the sixteenth century. They still exist in many countries, but with reduced influence. The dress of the order is a black mantle and a white habit and scapular. An order of Dominican nuns was also founded by Dominic.

Donatist (don'a-tist), *n.* [*LL. Donatista*, *Donatist*, < *Donatus*, a man's name.] One of an early Christian sect in Africa which originated in a dispute over the election of Cæcilian to the see of Carthage, A. D. 311, occasioned by his opposition to the extreme reverence paid to relics of martyrs and to the sufferers for the Christian faith called confessors, and the rivalry of Scenndus, primate of Numidia. Scenndus and the Numidian bishops declared Cæcilian's consecration invalid because conferred by Felix of Aptanga, whom they charged with being a traitor. They excommunicated Cæcilian and his party, and made one Majorinus bishop in opposition. The name Donatist came either from Donatus of Cassa Nigra, who headed the party of Majorinus at the Lateran Council in 313, where it was condemned, or (more probably) from Donatus "the Great," who succeeded Majorinus in 315 and under whom the schism became fixed. Repressed under Constantine, the Donatists revived under the favor of Julian the Apostate. Repressive measures, provoked by their frequent acts of fanatical violence, were resorted to from time to time. These measures, internal schisms, the conciliatory conduct of the orthodox clergy at a conference held at Carthage in 411, and the arguments of St. Augustine caused many to abandon Donatism, and the sect became insignificant, though not entirely extinct till the seventh century. The Donatist party held that it constituted the whole and only true church, and that the baptisms and ordinations of the orthodox clergy were invalid, because they were in communion with traitors. They therefore rebaptized and reordained converts from Catholicism. See *Circumcellion*, *Maximianist*, *Primitivist*, *Rogatist*.

The book was long kept under three different locks in the Exchequer, along with the king's seal, but is now kept in the Public Record Office. Doric cyma. See cyma, 1.—Doric dialect. See II.—Doric mode. See mode.—Doric order, in arch., the oldest and strongest of the three Greek orders, in its external forms the simplest of all, but in its most perfect examples, especially as exhibited in the monuments of the age of Pericles at Athens, combining with solidity and force the most subtle and delicate refinement of outlines and proportions that architecture has known. In a de-

based and distorted form, the Doric constituted the second order of the Romans, coming between their Tuscan and Ionic. A characteristic of the Grecian Doric column is the absence of a base; the channelings are usually 20 in number, and in section approximate to a semi-ellipse; the capital has generally no astragal, but only one or more fillets or annulets, which separate the channelings from the echinus. The profile of the capital in the best examples is a carefully studied eccentric curve, neither flat enough to be hard in effect, nor full enough to be weak. The echinus prior to the time of perfection spread out far beyond the shaft; the later Greeks made it a frustum of a cone, and the Romans cut it as an ordinary quarter-round. In good Greek examples, as a rule, no horizontal lines are found in a Doric building, floor- and cornice-lines, etc., being curved slightly upward; the profiles of the column-shafts are slightly convex, and all columns are slightly inclined toward the center of the building. All these particularities have relation to optical effects so subtle that their influence is felt rather than seen.

The first of the Roman orders is the Doric, which, like everything else in this style, takes a place about half-way between the Tuscan wooden posts and the nobly simple order of the Greeks. J. Fergusson, Hist. Arch., l. 293.

It is a contribution by the wife's family, or by the wife herself, intended to assist the husband in bearing the expenses of the conjugal household. Only the revenue belonged to the husband, and many minute forels . . . prevented him from spending it on objects foreign to the purpose of the settlement. 1. A wooden or metallic pin or tenon used for securing together two pieces of wood, stone, etc. Corresponding holes fitting the dowel being made in each of the two pieces, one half of the pin is inserted into the hole in the one piece, and the other piece is then thrust home on it. The dowel may serve either as a permanent attachment of the two pieces joined, or as a shifting one; in the latter case one end is secured by glue and the other is left free, as in the movable leaves of an extension table.

2. A piece of wood driven into a wall to receive nails of skirtings, etc.; a dook.

The property which a woman brings to her husband at marriage; dowry.

He is a father to her. *Fletcher*, Beggars' Bush, l. 1. 3.

He wedded a wife of richest dower,

Who lived for fashion, as he for power.

Whittier, Maud Muller.

2. In law, the portion which the law allows to a widow for her life out of the real property in which her deceased husband held an estate of inheritance. At common law it is one third of such real property held by the husband at any time during the marriage as the common issue of the husband and wife might have inherited, except such property as has been conveyed with the concurrence of the wife. The wife may also bar the right of dower by accepting a jointure. By modifying statutes, in some of the United States, the dower is sometimes a share in fee, and sometimes extends only to property which the husband held at the time of his death. In England, by the Dower Act of 1833, the common-law rights of the wife have been greatly modified, her dower being entirely under the control of the husband. In the earlier periods of the common law several kinds of dower were usual, as *dower ad ostium ecclesie*, which was dower voluntarily pledged by the husband at the porch of the church where the marriage was solemnized; and in this case the share might be less than a third, or (except for a restriction at one time imposed for the protection of the interests of feudal lords) it might be more than a third. This was, sometimes at least, done by the declaration in the marriage service "with all my lands I thee endow," or the husband might specify a particular manor or other lands. If he had no lands, or chose to mention goods only, the declaration was, as now, "with all my worldly goods I thee endow," in which case the wife, if she survived him, was entitled to a third of the personal property left by him; and if he left lands, the law, notwithstanding his omission to promise dower in them, gave her what was called *reasonable dower*, or *dower according to custom*, viz., the life estate in one third as above described, unless she had accepted a jointure or other provision in lieu of dower.

The dower of lands in English law . . . belonged to a class of institutions widely spread over western Europe,

very similar in general character, often designated as *doarium*, but differing considerably in detail.

Maine, Early Hist. of Institutions, p. 338.

3. One's portion of natural gifts; personal endowment.

He'n noble every way, and worth a wife

Beau. and Fl., Honest Man's Fortune, v. 3.

And if, as toward the silent tomb we go,
Through love, through hope, and faith's transcendent dower,

We feel that we are greater than we know.

At common law this is effected only by joining in the husband's deed of conveyance.—**To assign dower**. Modern senses in which the spelling *draught* is still prevalent over *draft* are indicated. In cases not so indicated, *draft* is the prevalent spelling. The compounds in which *draught* is the only recorded spelling are given under that spelling.] *I, n. 1.* The act of drawing or dragging (in any sense); a drawing; a draw; a haul; a pull. 15. The drawing or moving of air; the air so drawn or moved; a confined current of air, as in a room or in the flue of a chimney. The draft of a chimney depends, apart from the mode of construction, on the difference of the density of the rarefied column inside the chimney, as compared with an equal column of the external atmosphere, or on the difference in height of the two columns of elastic fluid, supposing them reduced to the same standard of density. The velocity of the current is the same as that of a heavy body let fall from a height equal to the difference in height of two such aerial columns. *Drafts* may be produced or increased (a) by a blast which rarefies the air above the fire (a *blast-draft*), or (b) by blowers which compress the air beneath the fire (a *forced draft*). When a forced draft is used on a vessel, air is forced into the fire-room, which is closed in such a way that the air can find egress only through the furnaces and funnels. In some recent vessels increased draft has been secured by the partial exhaustion of the air in the uptakes and lower parts of the funnels, which causes an increased flow of air from the fire-room through the furnaces. This is called an *induced draft*.

(cf. 2d aor. inf. δράκείν) of δρᾶσθαι, see, = Skt. darç, see. Cf. Dorcas. The older E. form is drake², q. v.; a later form with another sense is dragoon, q. v.] I. n. 1. A fabulous animal common to the conceptions of many primitive races and times, or, as in the Bible, an indefinite creature of great size or fierceness. When described or depicted, it is represented as either a monstrous serpent or a lizard (like an exaggerated crocodile), or a compound of both, or (as in heraldry) as a combination of mammalian and reptilian characters; but always as winged, with fiery eyes, crested head, and terrible claws. It is often represented as blood-red and spouting fire, and sometimes with several heads, like the Hydra; and in the myths of the Scandinavians and other races, dragons are often the guardians of treasures, etc. The killing of a dragon was reckoned among the greatest feats of heroes in both ancient and medieval times; thus, the legend of St. George and the dragon is one of the most celebrated in Christian literature. The dragon is the imperial emblem of China, and is regarded by the Chinese as a sort of divinity, but by other peoples generally as the type and embodiment of fierceness and cruelty or watchful malice. In the Apocalypse "the dragon, that old serpent" is a synonym of Satan (Rev. xx. 2). In the Old Testament it is either a large land-animal or a great marine fish (Isa. xxxiv. 13—revised version, jackal; Ps. lxxiv. 13—revised version, dragon), a venomous land-serpent (Ps. xci. 13—revised version, serpent), or the crocodile (Ezek. xxix. 3—revised version, dragon). The same Hebrew word, thanūm, is also sometimes translated whale (Gen. i. 21—revised version, sea-monster; Job vii. 12—revised version, sea-monster). The extinct pterodactyl comes nearest of all known creatures to the most prevalent conception of a dragon.

The structure is not a wing, and the animal does not properly fly, the arrangement somewhat resembling that in the flying-squirrel, flying-lemur, etc. The species are confined to the old world. drachm (drām), *n.* [Now also spelled *drachm*, after the L. spelling; < ME. *drame*, a dram (weight), < OF. *drame*, also spelled, in imitation of the L., *dragme*, *drachme*, mod. F. *drachme* = Sp. *dracma* = Pg. *drachma* = It. *dramma* = D. *drachma* = G. *drachme* = Dan. *drakme* (cf. Dan. *drām* in sense 4, < E.) = Sw. *drachma*, < L. *drachma*, ML. also *dragma*, < Gr. δραχμή, later also δραχμή, an Attic weight, a Grecian silver coin.] 1. A unit of weight less than an ounce. The dram is generally supposed to be of Greek origin. Many weights of this denomination and its multiples have been exhumed at Athens, belonging to different systems, of 57, 67, 75, and 78 grains troy, and there were doubtless others. The Solonic dram, the Athenian monetary weight, had at first 67.4, later 66.6 grains troy. The Æginetan weight was greater, and is fixed by the latest authorities as normally 97 grains. A dram afterward appears in Phœnician systems as a half or quarter of 4 shekel; and under the Ptolemies there was in Egypt a dram of 54.6 grains troy. Under the early Roman emperors a dram was introduced into the Roman system as 1/4 of an ounce, equal to 63.2 grains troy. This relation to the ounce has been preserved in several modern systems. Thus, in apothecaries' weight, a dram is 1/4 of an ounce, or 60 grains, divided into 8 scruples of 20 grains each. The avoirdupois dram, however (derived from the Spanish *adarme*), is only 1/8 of an ounce, or 27 1/2 grains. In the old Spanish apothecaries' weight a dram was 1/4 of an ounce. In the Neapolitan system 10 drams made an ounce of 41 1/2 grains troy. The Nuremberg drachm was 57.5 grains troy. The Tuscan dramma was 54.6 grains troy. In the Arabian systems the dram is properly represented by the mital, but the derham is often called a dram, and was in fact derived from the Attic *drachma*. Abbreviated *dr.*

Ep. Berkeley, Arts and Learning in America.

A *drama* is the imitation (in a particular way) of an action regarded as one, and treated as complete. In the observation of the process of a complete action, and in the attempt to imitate it in accordance with such observation, must therefore be sought the beginnings of the *drama*.

A. W. Ward, Eng. Dram. Lit., Int., p. xvii.

2. A composition in verse or prose, or in both, presenting in dialogue or seemingly designed, to be spoken in character and represented on the stage; a form of imitated and represented action regulated by literary canons; the description of a story converted into the action of a play, and thereby constituting a department of literary art: as, the classic *drama*; the Hindu *drama*; the Elizabethan *drama*. The construction of such a composition is, as a general rule, marked by three stages: first, the opening of the movement; second, the growth or development of the action; third, the close or catastrophe, which must in all cases be the consequence of the action itself, as unfolded in acts, scenes, and situations. The *drama*, whether in actual life or mimic representation, assumes two principal forms, namely, tragedy and comedy; and from modifications or combinations of these result the mixed or minor forms, known as tragedy-comedy, melodrama, lyric drama or grand opera, opera bouffe, farce, and burletta. Other forms, suggested by the subject and the manner of presenting it, are the nautical drama, the pastoral drama, the society drama, etc. Both tragedy and comedy attained a high degree of development in the ancient Greek drama, which originated in the worship of Bacchus.

Sophocles made the Greek *drama* as dramatic as was consistent with its original form.

Macaulay, Milton.

It is sometimes supposed that the *drama* consists of incident. It consists of passion, which gives the actor his opportunity; and that passion must progressively increase, or the actor, as the piece proceeded, would be unable to carry the audience from a lower to a higher pitch of interest and emotion.

R. L. Stevenson, A Humble Remonstrance.

In the epic poem there is only one speaker—the poet himself. The action is bygone. The scene is described. The persons are spoken of as third persons. There are only two concerned in it, the poet and the reader. In the *drama* the action is present, the scene is visible, the persons are speakers, the sentiments and passions are theirs.

Dion Boucicault, in New York Herald, July 6, 1838.

3. Dramatic representation with its adjuncts; theatrical entertainment: as, he has a strong taste for the *drama*.

Formerly also called *draught-bridge* and *draught*. See *draft*. Drawbridges, as applied to fortifications, date only from the beginning of the fourteenth century. The drawbridge was usually raised by chains attached to levers projecting from the wall at a proper distance above it, which levers were elevated by heavy weights attached to their inner extremities, the wall forming the fulcrum. dredging-machine (drej'ing-ma-shēn'), n. An apparatus for lifting mud and silt from the bottoms of rivers, harbors, canals, etc. Some dredging-machines employ a single bivalve or clam-shell scoop; others a series of scoops on an endless chain; others some form of suction apparatus. The earliest form appears to have been a single box-like shovel or spoon, suspended from a crane rigged up on a large flat-boat. It was lowered into the mud, dragged along by means of ropes till filled, and then raised and emptied into the boat. Another early form is the chaplet or chain-pump, which, by means of an endless chain carrying buckets traveling in a trough, lifts mud and water, discharging them at the top into a flat alongside the machine. On this plan are now built some of the largest and most powerful dredging-machines in use. They consist of large, flat-bottomed

Steam Dredging-machine.

boats, usually of iron, with a bucket-chain carrying nearly 40 buckets, each with a capacity of about 13 cubic feet. In excavating the Suez canal, the lifting buckets of some of the larger machines had a capacity of 5 cubic feet each, and the delivery was 20 buckets a minute. For the delivery of the sand or silt both chutes and traveling buckets were used, the spoil being, in some instances, delivered 230 feet from the dredger. The clam-shell dredger is largely used in the United States, and has the merit of ease of management, the scoop operating in a half-circle about the boat, so that a wide channel can be excavated without moving the boat. The scoop is suspended from a crane at the bow of the boat, and is operated by means of chains controlled by steam-power, two long flexible poles serving as guides for the clam-shell. In the machines employing a suction or exhaust, a tube is lowered into the mud, and the mud and water are raised by means of a revolving disk in the tube, or by the aid of a vacuum or an ejector. A large vessel on the boat, being exhausted of air, is connected with the submerged pipe, when the mud and water readily rise into the receiver. In another form of pneumatic dredger a pipe is lowered into the silt and closed air-tight, and steam is then turned into the upper part of the pipe, driving out the air. Many other forms are used.

5. In *geol.*, loose detrital material, fragments of rock, boulders, sand, gravel, or clay, or a

mixture of two or more of these deposits, resting on the surface of the bed-rock. The term *drift* was introduced by Lyell in 1840, to take the place of *diluvium*, with which latter word the idea of a universal deluge, and especially the Noachian deluge, had been generally associated. (See *diluvium*.) The word *drift* is now usually applied to detrital deposits when it is intended to include at the same time the transportation from a distance. Almost all detrital material has, however, been formed with more or less help from running water, and therefore must in that process have been moved to a greater or less distance from the place of its origin. It is especially with reference to material lying on the surface in northern Europe and northeastern North America that the term *drift* is used at present by geologists, and it is frequently called *northern drift*, since much of it has been moved in a southerly direction. And since ice is believed by most geologists to have been the principal agent by which this drift was moved, it is also denominated *glacial drift*, while the detrital material transported by the agency of ice at the present time is not so called. See *glacier* and *moraine*.

6. In *mining*, a nearly horizontal excavation made in opening or working a mine: nearly the synonym of *level*. The levels or drifts are the nearly horizontal openings in a mine; the shafts are the nearly vertical openings by which the levels are connected and made accessible. (See *level* and *adit*.) A drift is wholly within the soil or rock; an open cut is open to the sky. Also *driftway*.

In *ship-building*, the difference between the size of a bolt and the hole into which it is to be driven, or between the circumference of a hoop and the circumference of the mast on which it is to be driven.—9. The horizontal oversetting force or pressure outward exerted by an arch on the piers on which it rests.—10. Slow movement of a galvanometer-needle, generally due to changes in the torsional elasticity of the suspending fiber.—11. In *mech.*, a longish round and slightly tapering piece of steel used for enlarging a hole in a metallic plate; a drift-bolt; a punch. It sometimes has grooves cut in spirals on the sides, to give it cutting edges. Also called *driver*.—12. *Milit.*: (a) A tool used in ramming down the composition contained in a rocket or similar firework. (b) A priming-iron to clean the vent of a piece of ordnance from burning particles after each discharge. [Eng.] (c) In *gun.*, same as *derivation*, 6.—13. See *draft*.—**Glacial drift**. See above, 5, and *glacial*.—**Northern drift**, in *geol.*, a name given to houlder-clay of the Pleistocene period, when its materials were supposed to have been brought by polar currents from the north. A tool for boring holes in metal, stone, or other hard substance; specifically, a steel cutting-tool fixed to a drill-stock, bow-lathe, or drilling-machine. See cuts under *bow-drill*, *brace-drill*, and *cramp-drill*. In the widest sense, the term is used to include all drilling-machines, or machines for perforating stone, metal, etc., such as the *rock-drill*, *diamond drill*, *dental drill*, etc.; but not boring-machines which are used for wood. Also called *drill-bit*.

2. In *mining*, a borer: the more common term in the United States.—3. In *agri.*, a machine for planting seeds, as of grasses, wheat, oats, corn, etc., by dropping them in rows and covering them with earth. Such machines vary in form and size from a small hand-implément sowing one row to the gang-drill drawn by one or two horses, and heavy steam-power machines drawn by a rope from a traction-engine, as in steam-plowing. Horse-power drills are sometimes fitted with self-feeding devices for regulating the speed and the amount of feed from the hopper to the tubes that convey the seed to the ground. They all have some form of share or tool for opening or preparing the ground for the seed, immediately in front of the tube that distributes the seed. Nearly all forms have also an attachment for covering the seed after it has been dropped. Some of the larger machines, particularly for steam-power, are combined harrows and drills. Grain- or seed-drilling machines are sometimes called *seeders* or *seeding-machines*.

4. (a) A row of seeds deposited in the earth. (b) The trench or channel in which the seeds are deposited.—5. It lays its eggs in capsules containing about a dozen eggs. It ranges along the Atlantic coast from Canada to Florida, but is rare north of Massachusetts. Also called *borer* and *snail-borer*.

(a) A drill or borer which cuts by means of diamonds set like teeth in an annular bit or boring-head. The boring-head, which is a hollow cylinder, is made to revolve with rapidity by suitable machinery, so that a large hole can be made by cutting out only a small quantity of rock, a solid core of which fills the hollow of the cylinder and is broken off and removed from time to time. (b) In *dentistry*, a small iron drill into the end of which is set a small piece of bort.—**Double drill**, a drill with two cutters: used for making countersink-holes, as for screw- or rivet-heads.—**Double-traverse drill**, an adjustable machine-tool for making exactly similar holes simultaneously at a distance apart, as in the two ends of a bridge-link. Knight.—**Expanding drill**, a drill with a pair of adjustable bits which can be spread apart at any given depth, to increase the width of the hole at that point.—**Finishing-drill**, any form of drill making a smooth cut, used to follow a drill doing rapid but rough work.—**Fluted drill**, a drill upon which are formed, on opposite sides, two longitudinal grooves or flutes. The cutting faces at the point are formed by the edges of these flutes, which are cut away in conical form.—**Forked drill**, a slotting-tool with a forked point, used in a slot-drilling machine. It is either forged and ground from solid steel or formed by fixing two movable cutters in a stock. Its action is rapid, but it leaves a rough surface, and must be followed by a finishing-tool.—**Lip drill**, any flat drill upon the cutting edge of which a lip is formed, either by grinding or during the process of forging. The lip adds to the speed and cleanness of working.—**Persian drill**. (a) A hand-drill operated by a nut moved backward and forward over a quick screw on the stock of the drill. Also called *Archimedean drill*, *serpents-stock drill*.—**Piecing-drill**, a drill for making a hole, as distinguished from a finishing-drill or a slotting-drill.—**Pin drill**, a drill having a cylindrical pin projecting from the center of its cutting face. It is used to enlarge a hole previously made, or to face off the surface around such a hole, the pin being inserted into the hole and holding the tool true.—**Plain drill**, a drill of which the angular cutting end is formed on a flank flattened on opposite sides toward the point. Such drills do fair work for small holes, but should be made with the narrow sides parallel for a short distance from the point, to afford guidance to the tool in the hole, as well as for the needs of sharpening.—**Pneumatic drill**, a drill actuated by mechanism for which compressed air supplies the power; an air-drill.—**Rose drill**, a drill with a cylindrical cutting face, cut on the edge in a series of teeth: used for finishing, especially in slot-drilling.—**Roughing-drill**, any form of drill adapted for speedy working, but producing a rough cut, such as the forked drill.—**Screw-stock drill**. Same as *Persian drill*.—**Serpent's-tongue drill**, a flat-ended drill of which the point has the form of a sharpened oval. It is used in a lathe, and is not suitable for very hard or for very soft materials.—**Square-ended drill**, a drill of which the cylindrical end is beveled off to a straight cutting edge, from the center of which a small indentation is cut out: used for slotting, etc.—**Swiss drill**, a cylindrical drill of which one half the body is cut away at the point, and the remainder is sharpened in the form of one half of a quadrangular pyramid. It is a form of single-acting metal-drill.—**Teat drill**, a square-faced cylindrical drill with a sharp, pyramidal projection or teat issuing from the center of the cutting face. It is used to flatten or finish the bottoms of holes.—**Twist drill**, a cylindrical drill around the body of which is carried a deep spiral groove, so that the tool appears as if twisted from a flat bar. The point is sharpened to an obtuse angle. Such drills are used in all sizes, from a diameter of three inches down.—**Vertical drill**, a drill with a vertical spindle. E. H. Knight.—**Wall-drill**, a drilling-machine set up against a wall, and not fitted with a table to receive the work. The drilling-tool is often carried on a radial arm for facility in adjusting it to the work. It is used for large work, not adapted to be placed on a table.—**Watchmakers' drill**, a small drill with a spear-shaped head having an obtuse or but slightly acute point, the edge of which is usually sharpened evenly on both sides. In use it is generally driven alternately backward and forward.
